Your "wish list" for unobtanium is---unfortunately!---destined to remain just that for the most part, i.e. a "WISH" list...so you may well have to do some creative PARTS homebrewing on more than a few of those goodies that you're seeking...

In all probability the IF tranformers are the best candidates for homespun creativity---and here's a website that might inspire you along that very line:

http://www.angelfire.com/electronic/funwithtubes/IF_Can-1.html

Have a look-see, & use it only of necessary...and in the meantime, do please remember that collecting components for an elaborate project such as this can be half the fun of same!

Subject: [AWA Group] Wanted: Miller IF Transformers and Parts for Receiver Project

Want to buy some Miller IF transformers and parts for an HBR receiver project. I'm looking to build an HBR-13 from scratch. Would you please look in your junk box and help me out?

(2) Miller 1730 1800 Kc IF transformer
(4) Miller 1709 or 1710 10 KC IF transformer
(1) Miller 1711 100 Kc BFO

Eddystone slide rule dial
National HRO gear box that is inline rather than right angle
BC453 radio or ARC5 R23 190 Kc - 550 Kc receiver
Junker or uncompleted HBR receiver for parts

Thanks very much! 73, Scott WA9WFA

2005. National S-101

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-10 20:51:54 UTC
From: ve7sl@shaw.ca
Topic: 2005 Message: 2005

I was wondering if someone in the group might have a National S-101 that is gathering dust and would be willing to sell. Officially, it's a Screen-Grid Detector Coupler used between the detector and the AF stage and the same one used in the SW-3 regen....consists of a high value choke, fixed C and R, all inside a small transformer shell.

Hi Lou,
Not much different than grandpa's shirt collars. My limited experience with the stuff is that it is not very mechanically stable, when heated. Under the right conditions it is rather flammable.

If I am not mistaken it is the material used for the off-white scales on National B and
BM verniers and the logging scales on the FBx series receivers.

All you never wanted to know but were afraid to ask.

Does anyone know what this is? Item 150553308365. It is a cute little set. I have several copies of the Gernsback manual he references, however, they are in the basement and an exhaustive search has not revealed any of them. He gives a very thorough description, so, I need not repeat it here. The two pheonolic (sp ?) tube sockets are marked with their respective tube numbers and are riveted to the chassis. All appears to be original, and, not home brew. Did National really make this? Thanks & 73 - Mike

2026. Single triode regen schematic

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-14 03:18:19 UTC
From: Don
Topic: 2026 Message: 2026

I have a 1930s/40s style station up and running. (Ham Radio After Dark on Youtube) I have now built and tested a 1920s style TNT tx using a UX245 tube. I dont like using a vintage TX with a modern or even more modern rx. I feel like it is somehow cheating so I am trying to build a single triode regen using a 1920s tube. i have had it going but am not happy with it. The volume is not the problem. It just doesnt work well or consistantly. Does anyone have a good schematic for a good working regen using a 201 or a 71A tube?

I made one using a cd disc for the plastic or celuiod. I know it isnt really OEM but it looked pretty good to me.

Thanks Lou,
Well I love antique wireless stuff. that is for sure.
The single triode rx has ben quite a challenge. I am still committed though to a genuine 1920s style operating station on 40M. Going to rebuild the circuit today and see what happens.

Lou,

I have lots of OT stuff in my quasi Museum! My Collins 4A along with my original, built in December of 1929, TNT with a 210 is right up near the top of my list. I am currently working on building a Hartley transmitter based on the Ross Hull article in QST. Last year I got a real nice high power Millen transmitter which I have been working on. In between all of that, I am restoring a gift my wife gave me 2 years ago for Christmas, which is a Johnson Desk KW transmitter.

Plenty of projects so I have no time to get bored!

> a 71A tube?
> Don VE3LYX
>
>

Don, I don't know if I can recommend one schematic over another, but will give you my 2 cents as the following random thoughts:

- With a triode, I think the throttle capacitor method of regeneration control is the best.

- Instabilities in regen sets are often mechanical - a dirty connection (such as between a tube or plug-in coil pin and its socket) can create all kinds of havoc - much more so than in a superhet, for example.

- Good quality parts and mechanical stability are essential.

- To slow down the tuning rate I'd use 2 tuning capacitors, a larger one (bandset) and a small one for bandspread. Use a good quality vernier dial on each, and also on the thottle condenser.

- Minimally couple the antenna to the tuned circuit - less is more. Variable link coupling works best.

- I would go with one or two audio stages after the regen detector, or you'll only hear the strong ones - probably one stage is enough.

- See the link on my web page for the 1926 ARRL Handbook Receiver given to me by W1UJR, which is a 201A detector followed by 2 cascaded 201A audio stages.

I rebuilt the whole thing yesterday As larry alluded to I di fnd a defect in the tube socket and corrected it plus somepreventative maintenance (aka bending contacts) as well. I removed about 21/2 feet of wring and redesigned the laypout. I did the throttle cap regen. I have too much cpacitiy there but I do have it up and running. I did some SWLing for about 1 1/2 hours last night. I played with gridleaks to slow down the thunk as it goes from regenration to full feedback. Wound up with 6.1 megs and a 150 pf cap. I played with voltages and got B plus optimized at 72v. It works best there. Any more it looses something any less it doesnt have the volume. Regen is still too fast so I will try a cap with fewer plates and \or soldert two tickler turns together to see if that helps. Volume isnt too bad. I have a ancient variable in the tuned circuit. It has a multileplate cap in front and a long rod going through that shaft running a single plate in the rear. It works not bad. I have built it to run with my flea power TNT tx (UX245) so I am not worrying about dx too much. Any contact will be exciting with that station. With the other vintage station the thrill of making a QSO with old style vntage gear is so much I can hardly still copy cw when I hear my call comng back to me. Didnt know I had that much emotion left! The glow of the tubes , the squeal from the regen in crowded qso territory., the chirp form someones vintage rig pounding away and the flash from my rf indicator (aka flashlight bulb in a single turn loop) and I pound out a reply is just an absolute wonderful way to spend an evening. I truely believe REAL RADIOS GLOW IN THE DARK!
Don VE3LYX.
I found a UX201A tube in my stockpile . It performed the best in this circuit.

> Regen is still too fast so I will try a cap with fewer plates
> and \or soldert two tickler turns together to see if that helps.

I would advise against shorting out any turns in the tickler, It will look like a shorted turn (go figure!) to the grid coil, and greatly reduce the Q of the grid circuit, which you want high for best selectivity and maximum output.

You can reduce the capacitance range of the throttle air variable by putting a fixed mica cap in series with it (one end of mica to the stator, one end to the side of the tickler winding OPPOSITE from the plate side).

> Volume
> isnt too bad. I have a ancient variable in the tuned circuit. It has a
> multileplate cap in front and a long rod going through that shaft running
> a single plate in the rear.

The BCB regen my grandfather built (single UV-199) has a air variable like that, as does my homebrew SW crystal set.

Welcome Joe,

I would like to hear about the high power Millen station you acquired. Please tell us what Millen units you have? Sounds like you have some serious work in front of you, albeit fun work!

I am just getting caughtup on my emails now so i read your warning to late. already tried it and of course you already know it didnt work but now I know too. It took a couple of seconds to undo it. I had wondered about putting a cap in series . I didnt know what to use but have a decent selection. I have it working better all the time and now have it working on 40 M Cw band. Copied WA2BCK tonight calling CQ. I also dont have it on a good antenna or shopuld I say regen friendly antenna. I like to use a loop as they really really settle the rx regens down. I use my 80 M 6SL7 on one and it works almost like a communications rx. I dont want to switch antennas since I have it cooking perfect and dont feel like fooling with it. Right now I have the new regen on my 20 M vertical. That is more than most regens need or like so I think I will make another loop late next week. I have two speaking engafgements this comng few days. One in Brockville to a historical group and one next week on ham radio including vintage operation to the Rednersville WI. After that I can make another loop.At least I can show them the 40M rx with honesty knowing it and its tx both work. I will probably make the loop first then fine tune the radio circuit till it is happy with it.
Yes tis true, antique or vintage sure puts the fun back in ham radio. I have a fridge (appliance) too (TS830S) but this vintage stuff is FUN!

I am set up on 3561-3562kcs on 80M. I just got home and caught up so I am late reading this. If you are there i will go on at 10 PM tonite. If that freq is not good we will set something up tomorrow. I have a couple of other rocks but not huge selection.
Don VE3LYX

Don,

I'm done in for this day. Are you available tomorrow Wed. night? If so, what time? As to 3661, that is close to the QRP call-in freq so might be best to try another freq., any of ur choice is fine here.

It's Coop's radio now! That set was purchased at the end of my 1st AWA Conference in the flea market for $35; it was going begging and I felt sorry for it. It's a well-built radio, and I definitely got my $35 worth out of it in fun. I already had a very similar set, an NC-100XA, which I still own, and use.

> Larry is as nice a guy in person as he is on the net and on the air.
>

Tnx for the kind words, Coop! Glad you're enjoying the set. You actually helped my out by making space for the RME-69 I restored last summer.

Topic: 2063 Message: 2063

Uh-oh... it's time for a dumb newbie question!

I've been following the discussion on throttle regen with great interest, but do not recall having seen any circuits using that in my research. I would like to see some circuit diagrams (several, preferably) to get a feel or it and whether it is a potential mod for the receiver I plan to construct. Sounds interesting. Anyone got some circuit diagrams to share?

Also, did I correctly infer there is a group somewhere for discussing regen receivers? Might be of interest. The rx I've been planning to build also needs a different method of antenna coupling in order to use it with what I have for antennas, so more dumb questions are likely forthcoming at some point. I think I know how to do this, but not sure. :-)

It's actually quite common; if the cat wasn't sleeping on my shoulders at the moment I'd go find a reference or two. The "Doerle" circuit is one example. With throttle cap. control you have a variable capacitor between the "cold" end of the tickler winding (the side OPPOSITE the side of the tickler connected to the detector plate), and ground. Stator goes to the tickler, and the rotor is grounded. For maximum feedback the "far" side of the tickler wants to be at RF ground. So think of the throttle cap. as a "variable RF bypass" cap. Feedback/regeneration is maximized at maximum capacitance; and minimized at minimum capacitance. An RF choke between the tickler/throttle cap. stator junction, and audio plate load (audio xfmr primary, phones, audio choke, plate load resistor, etc.) is essential.

I think the group is called "regenrx." Please describe the circuit you are planning to build - what is the method of regeneration control, and antenna coupling?

Yes I discovered accidently that a receiveing loop is more than enuf for a good regen and is to a regen what vailium is to a nervous wreck. Immediatley it settles down and becomes a very decent radio. Difference of day and night. Also gone are the sprious emmisions that were showing up on my wifes bedroom tv at night when I stayed up late to operate. Even though her analog Tv antenna is 7 feet above where I am operating it now does not bother it in anyway. After that I began using the radio for QSOs and even in heavy QRM/QRN was able to follow the signal. Hand capacity become mimal although not completely gone but only a slight note change .which is few cycles. and so you dont lose the signal. That too could be dealt with I think. A chord drive on the variable cap would probably be an instant cure. Or a long wooden shaft with the cap at the back of the set. Tis hard to say but it would be worth a try . The 6SL7 twinplex style deal though has become my QSO radio of choice. It is more senstive than the rest and has very good manners since mating with the loop. My loop is 12 inch dia with 12 turns of Hookup wire wound around it a braided lead in to the set. It sits as you suggested inside in the window. I have worked with it and my DX 394 as well as a DX 160 both of them on a big antenna. It can hear stuff well they can barely hear and stuff they will never hear. That is probably why I like regens so much. The soft glow of the tube isnt bad either though!

From: Don Dulmage
Topic: 2063 Message: 2067

The throttle cap simplifies the set a lot.
The circuit contains a tank circuit for tuning. . One end connected to ground and cathode (filments incase of ancient tube like mine. Other end goes to a gridleak assmbly which is typically a 2.2 meg resitor inparallel with a 100 to 150 pf capacitor. The variable capacitor in the tank circuit should not be too big a value and the less band spread you have the better the set is to run. I use two variables in my tank circuits. One around 100 pfs and one less than 30pfs.(Whatever i have)
THe tickler is would below themain coil in the tank circuit. The bottom end goes directly to the plate and the other end to a rf choke which s made by winding a bunch of wire willy nilly arounda half inch wooden down. (3 or 4 feet of #22 for instance) The other end of that goes to theone side of the 2000 ohm phones or to the high impedance side of a audio translformer. The B + is supplied to the other side of that. (other phone lead or audio transformer high impedance winding. B- of course goes to ground or cathode. The throttle cap goes as stated from tickler plate side to ground or cathode lead. That is it . This circuit will work . I was trying to get too fancy. Keep all leads very short. Be fanatical about it. Ant is lightly coupled to the grid side of the tank circuit coil with ant trim cap or a gimmick capacitor.Then you fire it up a nurse it along till all of the sudden the world is banging on your headphones. Most good circuits have an audio amp as well . Some coupled with an audio transformer , others resistance coupled. A double triode makes the best I think. My favourites are the 6SL7 and the 12AX7 and its similar cousins. This single triode regen was an exercise in building a legit 1920s station. Dual triodes were not available then and I believe that the single triode station was used because it worked and was inexpensive. It was though I must say a real challenge. There is no forgiveness when you have only one 90 year old tube and a handful of parts. But it is working now and I am happy. If you build one you will be too I think. Might I be so bold as to suggggest that Lindseys book on Regenerative receivers was for me a huge help.CF Rockys is great too but for specifics I liked his the best.. I should also say that I use pot regen conrol on all the other ones I built and I like it very much. With this particular tube (UX201A) and design the throttle cap worked better and dropped the parts count measurably. There are other ways to do it as well.
If you want my circuit email me direct and I will draw it out for you by hand with the final values i wound up with. Be advised though it is scaringly simple. .

Thanks! If I'm picturing that right, then it doesn't sound like it
would easily be adapted into my planned circuit. Or at least not by
someone with my current level of knowledge.

> Please describe the circuit you are
> planning to build - what is the method of regeneration control, and
> antenna coupling?

I had settled on "A Simple 1750- and 3500-Kc. Receiver" from
November, 1929 QST. At the time it looked like a simple (but not TOO
simple), low cost entry level regen of the era. But I'm starting to
question that choice. A single wire or single wire fed antenna isn't
going to happen here. I need something I can use with my existing
crop of coax-fed antennas.

I will attempt to describe the original circuit. It is a two tube
regen with 201A detector and 201A amp. The antenna/grid coil is
designated L1 and L2, but is really one coil with a tap. The single
wire antenna connects to one end of the coil (L2). A tap part way
down (junction of L2 and L1) connects to ground and to one side of
the tube filaments. The variable tuning condenser is connected from
this tap to the other end of L1, which also connects to the grid
leak and condenser.

A tickler coil (L3) is placed near L2. One side of the tickler goes
to the plate of the detector tube. The other side goes to the plate
side of the interstage transformer primary. The other side of the
transformer primary goes through a variable resistance regen control
with bypass cap, to B+.

I've been thinking about making L2 a separate coil, not electrically connected to L1. L2 would be connected across the coax feeder with some method of variable coupling to L1. I thought perhaps I might put a variable condenser in series with L2 as well. Clear as mud?

I am open to suggestions, including "scrap this plan and build something else!"

Hi Paul,

"...I need something I can use with my existing crop of coax-fed antennas..."

****

Beware the dreaded "...SIGNAL SUCK-OUT" when hooking-up a resonant antenna to your regenerative receiver...!!!

You'll age 10 years trying to figure-out why your (example) 80-meter regen won't regenerate when connected your 80-meter dipole.

I re-learned this fact the hard way awhile ago when I built a regenerative RF pre-selector for use with my 1929 superheterodyne receiver (the former of which, BTW, will be published in the summer edition of THE AWA JOURNAL, per editor Marc Ellis!).

Oh.... I get it now! (Duh!)

That does look simple. It looks like that may work with the receiver
I was contemplating, though it would not reduce parts count. However
it would end my search for an authentic period variable resistance
for the regen control. :-)

Thanks Don.

Regens do not need and can not handle a big antenna. They are too sensitive and will perfom badly and sometimes not at all on one. 6 feet of wire will typically hear the world with ease. When a good one working even on batteries and no signal is present you can hear the wiring in your house even though you know there are no connections anywhere. Your communucations rx is not that sensitive. I know that sounds like hearasy but it isnt. They are that good. I would suggest you build the first one EXACTLYas it is in the book. After that you can play. Regens are tricky which is why they arent used by the general public. It can be very frustrating designing your own . I just went through this and even though I had some crcuits to work from I was 3 weeks everyday getting it to this point. From the book works immediately. A lot would just chuck it when it doesnt work. In my other life I worked at simalar stuff with engines so I was used to putting in the time necessary to sort it out. I made probably 100 trips downstairs and numerous changes. My regens breadboard looks like it has the measeles now. I worry that would discourage a first time regen builder and so wanting you to enjoy your project I would suggest again first build, do it by the book exactly. After that you can try anything but will have tasted success which is critical to enjoying any hobby.

Thanks again Don, and to Eddy for a similar warning.

This being the case, I'm probably better off not to build a regen at all. It WILL NOT work here with any sort of antenna in or near my home. I might hear the guy across town or the guy 500 miles away with a kilowatt, but that's about it. There is far too much noise here. I get away with operating from here only by using coax fed (and usually directional, eg. Beverage) antennas located as far from power lines and buildings as possible.

I had been under the probably mistaken impression that a big antenna could work if coupled lightly enough. If not, then I will just have to resort to using a relatively modern receiver!

Hi Don,

Thanks for the welcome!

Here is a list of Millen gear I have. My plan is to use it along with the National HRO-5. A niece open frame rack should show the gear off pretty well. Fortunately ,when the gear was given to me its was in prestine condition. I don't think it will take much to get it up and running. When I aquired it, I also got some original station photo's of the orginal owner that was operating the gear. Unfortunately he passed away (SK) a short time after he bought it. All the coils are still in the boxes and unopened except for the 10M coil that he opened so he could try it out on 10. A few QSO's later he became an SK. His son who is a Ham, kept it for many years and then heard about my working museum I am building and donated the rig to me. I will thrilled to be the selected person!

Anyway here is the gear:

90881 PP Final

90801 50W exciter

90831 40W modulator

90281 HV supply

90711 VFO

9020 P.S.

I had previously owned the following:

90902 scope

90800 50W transmitter

90700 Vari-Arm VFO

73,

Joe, W3GMS

Thanks Paul for the great welcome! Yes, I would have cleaned off the dust of the orginal TNT if I knew Steve was going to put it on his great website! Its a fun rig to operate and I built an OT type power supply that pretty much matches the style of the 29 TNT.
Yes, let me know when your up and running and we will have a QSO.

Hi Paul,

Oh my, I think you've misunderstood...!

The regen will work GREAT with a Beverage...or a random wire, or ANYTHING, just as long as the antenna is NOT RESONANT at the frequency you have the receiver tuned to.

Such resonance will "kill" the ability of the regen to resonate. Sounds complicated, but it really isn't.

Those receivers are SO sensitive that even a short length of wire will amaze you. I know, too---when I first built my 4-tube 1929-style regen, I was straining to get some of the guys in the Sunday afternoon AWA AM net just across the lake from me to get over the "5x6" signal level...

...And then it occurred to me: all I had hooked-up to the antenna terminal of the receiver was a coax jumper some 24" long...!!!

Believe me, you WILL hear DX with that regen, and THEN some...!

Hi Eddy,

Perhaps I did misunderstand!

I may have also contributed to any misunderstanding. When I mentioned coax-fed antennas, I had the Beverages in mind. Even if 300 feet from the "shack" and noise sources, I consider dipoles and the like to be transmit-only antennas. :-)

As an illustration, during the recent Linc Cundall event I was switching among various antennas, using a modern receiver. I heard many participants on the Beverages, but not one of them was audible through the roar on dipoles or verticals.

No No No No !
With a 6 foot piece of Wire you could hear Igor Kutyuso (EW8) something)in Belaruss sneeze. It is not about not hearing it is about not needing or overloading. I know, I understand. you are thinking I wont hear anything without a decent high antenna. But you will you will hear stuff your best superhet can not hear. I lie not. It is so.How can a simple one tube radio hear so well? Thats how regens work. One tube used many many times. Amp factor in the 1000s according to CF Rocky. Is able to beat the heck out of 8 tubes used once.

It sounds like the same exact receiver described in the 1930 "How to Become a Radio Amateur" book, of which I have a reprint (by Lindsay). Just pulled it out and am looking at it now. If you wanted to use throttle regen control, you would eliminate the regen variable resistor and its shunting capacitor (replace it with a direct connection from the "bottom" of the audio xfmr primary to 45V B+) and insert an RF choke between the "top" of the tickler coil and the "top" of the audio xfmr primary. Then the stator of the throttle condenser goes to the junction between the "top" of the tickler and the RF choke, and the rotor to ground/common (the bus going to the junction of L2 and L3 in the schematic). Or you can build the circuit as printed, if reproducing the design as closely as possible is important to you. But I suspect regeneration control will be smoother with throttle cap. control.

> put a variable condenser in series with L2 as well. Clear as mud?
>

You certainly can do this, but you don't have to in order to use a coax-fed low-Z antenna. The center conductor of the coax would go to the "bottom" of L2 and the braid would go to the top/common/ground end. Of course a separate movable L2 for adjustable link coupling is the ultimate, but harder to implement mechanically. I think I would wind L2 on a hollow form slightly larger than L1 and no longer than necessary to accomodate the L2 turns, so that I could slide it over the L1 form and move it closer or further away from the bottom of L1 so as to adjust the coupling. Mounting the coils horizontally would eliminate the problem of the link heading south of where you want it from gravity. The 8 turns specified for L2 is probably about right for a coax-fed antenna, but you may want to experiment with less. And your description of the circuit is very clear; good job!

> I am open to suggestions, including "scrap this plan and build
> something else!"

NO! Paul, no need to abandon your plan. Your regular resonant outdoor ham antenna WILL WORK JUST FINE with a regen as long as the coupling is light enough - I do it all the time! Use variable link coupling with a small # of turns on the link, and you'll be OK. Just make sure you can move the link coil at least 2" from the grid coil.

The way Don is coupling his antenna - trimmer to the top end of the grid coil - necessitates a high-Z (short) antenna, so his experience makes sense.

It is with some hesitation that I offer another possibility for a regen RX that may be too sensitive (if there is such a thing) changing the grid leak resistor to slightly lower values will de-sense it. While it is an extreme case my CW monitor is a regen with only a 100K grid leak.

Interesting.
With a pot controlled regen it is a matter of turning the pot back a bit.I am not sure how all that works with the throttle cap but will be finding out soon. I dint play today as I was saving my batteries for my sked with Lou tonight. I play with gridleak resistors to control the speed at which it goes into regen. With my radio too low and it wont come in and out. The higher I go the better it works (Wider range to play going in and out of the edge or fringe) so you may be right because the opposite would have to be true as well.

2085. Regenerative Superhet on 15 mtrs?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-17 03:25:51 UTC
From: john_kb7nrn
Topic: 2085 Message: 2085

A while back I built a Regenerative Superhet. 6K8 mixer, 6J7 regen detector and 6J5 audio. I borrowed heavily from Neil, WØVLZ's three tube super which is based on George Grammer, W1DF's Two Tube Superhet. I put some pictures of it in the Photo Albums under John kb7nrn/super sw-3.

Anyway, I was playing around with it today and found that it was able to receive up to 17 mtrs with good results. CW and SSB stations were coming in about as good as my modern SSB rig. I'm thinking of winding an antenna coil to go up to 15 mtrs. I think the oscillator coil is good to 21 mhz, if not will wind an osc coil too.

Just thought it was pretty neat to get a three tube superhet up that high in freq. Might even add a crystal in the IF for better selectivity.

Oh and how about a homebrew CW TX that goes that high?!

John

Thanks Larry. I had some kind of mental lapse the first time you
described it. The light came on as I sketched out the circuit when
Don described it yesterday. Then I went back and looked at your
first reply, and realized you'd said exactly the same thing! Oops.
This is of course a rather minor change to the circuit.

> Of
> course a separate movable L2 for adjustable link coupling is the ultimate,
> but harder to implement mechanically.

I have in mind to try a rotating or swinging L2. Rotating would be
more attractive to me so I will probably give that a try and
experiment with number of turns if necessary (that is, if rotating
the link to minimum coupling isn't enough).

I'm not concerned with reproducing the receiver circuit as
published. I wish to use only techniques (and wherever possible,
parts) that were available in 1929, but don't mind making changes
consistent with that.

I appreciate everyone's input on this!

Oh, and by the way... I do understand making any changes to a regen
circuit may "break" it and perhaps require some considerable
experimentation to "fix" it. This will no doubt be different, maybe
harder, but I have some experience with deBUGging my own designs
(for more modern gear) over the years.

Hi Larry,

I never even thought about employing a variable link coupling at the input end in order to negate the effect of "signal suck-out"---that's a really good idea.

I HAD messed with the notion of a series-inserted "antenna trimmer", but the results were not as good as I might have expected.

Thanks for the tip...

Hi Larry,

I never even thought about employing a variable link coupling at the input end in order to negate the effect of "signal suck-out"---that's a really good idea.

I HAD messed with the notion of a series-inserted "antenna trimmer", but the results were not as good as I might have expected.

Thanks for the tip...

For variable input coupling I like Bill Meachum's method with a moviable antenna coil. It's an old idea as can be seen in his Grebe CR-18 circuit.
http://www.sparkbench.com/homebrew/grebe/cr18.html

He also imployes it in antoher two tube regen.

2091. Cardwell type E capacity

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-17 18:01:09 UTC
From: N1BUG
Topic: 2091 Message: 2091

I have a Cardwell type E variable condenser with one stator plate and one rotor plate. Does anyone know the capacity of this?

The 1928 Cardwell catalog does not list any type E less than 75 pf, nor goes it specify number of plates for any type E. However, given it has similar plate size and spacing to the type B condensers, I extrapolate it to be around 25 pf...???

Has anyone tried an rf amplifier to isolate regen coil from coax with resonant antenna.
Seems like I have seen this done.

No problem, Eddie; glad you found something useful in my post!

Yeah, it's all a matter ofimpedance matching, or lack thereof. At resonance an antenna looks resistive, with no reactive component. So when you couple it to a tank circuit it will load down the tank circuit, just like it does with a trnsmitter. And when a regen is oscillating it's a QRPp transmitter. What happens when you couple your Colpitts osc. XMTR too heavily to the antenna? At some point it will refuse to oscillate. Back off on the coupling and all is well again. Same is true for a regen: with no reactance, it wants to be very lightly coupled to the antenna, or it will just load down the tank circuit to the point it performs poorly (due to the lower Q) or refuses to oscillate altogether.

Short antennas capacitively coupled to the grid only work because they look hightly capacitive (draw, or imagine, the vectors and observe a very small resistive/real component (bad) but very large capacitive/imaginary component, so the total impedance (the vecor sum) is high. The capacitance in the antenna is in series with the trimmer in the set, so the net capacitance is the series combination of both.

Yep, that would help reduce the capacitive coupling, while maintaining inductive coupling. IIRC there was a way of making a sheilded link for XMTR output links with coax. The same method might be applied to a regen, but it would not be authentic for the 1920s.

Wade wrote:

Sure, it's been done many times, and is very effective. My SW-3 hooked up to my station antenna systems via coax, which is the way I always use my SW-3, is one example. I've also built a three tube regen with an RF stage (35 RF, 27 det., 27 AF amp) and do the same thing. There is so much gain in the SW-3 that the RF gain control is "throttled" way back so as not to overload the detector. I also have a resistive attenuator right at the antenna input on the homebrew job; not as much gain there but still need to crank it back for strong sigs.

Thanks Lou. Very interesting!

> What are you using it for?

Maybe nothing. I'm considering trying to use it for a receiver band spread condenser. Physically it is a bit large. I will need to consider/investigate whether that would lead to any layout or lead length issues.

There's a bit of a strange twist to this. Several weeks ago, I was thinking about homebrewing a variable condenser with adjustable plate spacing for receiver band spread. My thought was to have some control over the tuning rate. I discarded the ideas as being silly, a lot of work, and something that probably wasn't a known or used practice in the 1920s.

I later bought this Cardwell, thinking it might be a candidate for the receiver band spread. I didn't know it had variable plate spacing when I bought it!

Hi Don (and group!),

Actually. it is Paul N1BUG that's presently contemplating building a regen, and he's the dude to whom we've been offering advice.

I've built several so far in my lifetime, and hope to build more in the future. (I've recently got a Tesla Coil Jones, so that's where my construction energies are being presently expended.)

Coupling to the top of the grid coil with a short wire antenna through a small series capacitance certainly works, but it's not the only way. Sometimes you need to get the antenna out of the house, out in the clear, and away from local noise sources. And it's very possible, but the coupling method needs to be modified.

You are absolutely correct about the patience, experience, and fun factors!

Paul,

This looks like an excellent candidate for using as your bandspread cap.
I would adjust the plate spacing for minimum capacitance for the slowest
tuning rate, were it me.

Very cool that Lou was able to come up with the specs so quickly, too!

Doing so would produce a tuning range of a little over 100 kHz on 80
meters. With a vernier that would result in a nice slow tuning rate.

With all the talk and comments I realize some have not heard a regen running. I took my polaroid video camera and stuck it between my left ear and that part of the headphones and threw the knife switch to apply the battery power. You will hear the set come up from a cold start to full operating. I did not touch it from what I had it set last night when Louis and I had a short qso with our two vintage style stations. I just put the camera by my ear as described and threw the knife switch. Maybe not the best way to get sound and I could have optimized it more but I wanted you to have a real life feel for how it works. This regen is a 6SL7 Regen which is a single twin triode using a pot controlled regeneration control which varies plate voltage on the first stage of the tube. The other triode section of this tube functions as a resistance coupled audio amp and is most of the time at 1/3 volume which it is here. The volume though is not linear so this is actually about 2/3 of max. The set is using a 12 inch loop antenna which is indoors looking out the window in a south east direction. The loop very much stabilizes the set. It needs no more antenna than this as it is very very sensitive. I hope for those who may wonder what it is like to run one in a ham use mode that you will have a look and listen to it.

GM all,

After a hiatus, I have gotten back to my Hartley project. I have finished my power supplies, and they seem to work fine. Using a Variac and a my homebrew ac/dc converter, I am putting out 240 volts DC with key up and 220 with key down. Meter is showing 26 ma or so. This is the first time that I have used the plate power supply, and now I am getting a buzz or growl. The rig did not make this sound when the plate was powered by batteries.

I've listened to growlers online, but I don't think that my rig is supposed to sound like this. My guess is that there is something in the power supply.

Thoughts?

Terry,

It sounds like your power supply needs some more filtering. If you have a scope you may look at the ripple voltage out of the power supply under load. Are you using a filter choke with the supply? If your not using a choke I would suggest one.

I am not sure what tube your using, but if its a directly heated tube (no cathode), then its important to have use the filament winding center tape as a B- return. If the transformer does not have a center tap on the transformer then use a low value tapped wire wound resistor to create the center tap which again is the B- return.

Hope that helps!

Joe, W3GMS

Don,

Specifically, I would like a demonstration of a regen in use. I've only operated two regens and then only for a few minutes. (Tks agn SW-3 Larry.)

You know, tune around for CW, SSB & AM ham sigs. Dwell on them for a bit so the viewer has time to take it in. Tune for weak a CW sig within heavy QRM. Demonstrate the effect of regeneration on a CW sig.

Oh yes, if possible, ratchet up the audio gain.

Tks & 73, Lou

>
You've had some good ideas and helpful responses, but there's another cause of this I haven't seen mentioned - RF getting back into the power supply and mixing with 60Hz energy there. Try bypassing the filament and B+ leads to ground, and/or an RF choke in the B+ and/or filament leads. For the latter you may want to try an RF-suppression core, or wind a bifilar choke on a ferrite rod or toriod. If you want it to be period you can try winding some chokes on sealed wooden dowels. Play around and make sure this is the source of the problem first. If the note is clean on 160M and worse on 80M, and worse still on 40M, this could well be the issue.

I remember reading somewhere that this was a particular problem for someone when they went from a filament transformer separate from the plate transformer to a transformer where the filament and plate supply windings were on the same core.

2136. Want to buy Parts for some Receiver Projects

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-19 14:06:37 UTC
From: whitebear1122@comcast.net
Topic: 702 Message: 2136

While I'm collecting parts to build an HBR receiver, I've decided to build an intermediate receiver to gain some experience preparing a chassis, drilling and tapping, hole cutting for the tube sockets, etc.. wiring, front panel construction, etc..

I'm thinking of building the 2X4+ Superhet. It's a early 60's or late 50's design, 5 tube not counting the OB2 regulator. It uses some shielded adjustable RF coils in the IF instead of regular IF transformers. My junk box is empty in the coil department so I need to start building that up. I sure miss the old days when I'd go to Satterlee electronics in Madison with my list, QST article, and walk out with all the parts.

They call out these values but anything in the ballpark will work 64-105 uf and 36-64 uh adjustable shielded chassis mounted coils. The article called out "North Hills 120-F in North Hills S-120 shield can". I've never heard of those folks before. I'm figuring there are some Miller or Millen or Meissner equivilent out there.

I'm also looking for some 1800 Kc IF's from the 3-6 Mc ARC-5's, plus the BFO from a BC-453.

Also looking for some Miller 612-M1 IF's, 012-M5 BFO transformers.

Still looking for the Miller 1709, 1710, 1711.

Also looking for any junker or partial build or rough HBR's to use for parts.

Also looking for a suitable small cabinet with a lid for the HBR project. I'm still figuring out the sizes, in the 15"wx11d "x10 h " catagory and 21"w x11"d x 10" h

Thanks, 73, Scott WA9WFA

2137. RE: Hartley Growl

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-19 18:53:33 UTC
From: Allan Pellnat KX2H
Topic: 2137 Message: 2137

Regarding your Hartley inheriting a growl when you went to a rectified plate supply. It does indeed sound like RF feedback into the power supply. But the question that popped into my head had to do with what tube you are using. I work on the WW2 Navy TX and RX aboard the USS North Carolina Memorial Museum. These are late 30's vintage gear using 860 and 861 tubes starting with a master oscillator tunning between 2 and 4 MHz and then doubling up through succeeding stages for a top range of 18 MHz. Our TBM-4 specifically also has a growl that is maybe a T7 or T8 at worst on 80M and gets progressively worse as we double up for 40M and 20M operation. Old Navy Ops all tell us "They all sounded like that."
The problem, in our case, comes from directly heated cathode filaments powered by 60 Hz AC. The DC plate voltages are produced by Motor-Generator sets and the resultant DC is well filtered. The directly heated cathodes introduce a small 60 Hz AM modulation on the MO that gets doubled and quadrupled up through the stages. Loading of each successive stage has an effect on how "harsh" the growl sounds. In the recent NC QSO party operating a bonus point station from the ship using NI4BK callsign we got tone signal reports ranging from 0 to 9. One Op swore we were using raw AC on the plates. It seems that the majority of the ears on the air today have never heard anything but pure T9 DC tone and have no grasp of the scale from T1 to T9 as described on page 68 of the most recent issue of QST.

Hi,
     The TBL-8 we had on my old tin can had a PDC note and was powered by an MG set. The signal did wobble a little when the seas got rough but that was because the long wire antennas swayed to and fro.

Looks like a nicely made home brew display. The name plate obviously came from the capacitor, and the low voltage would never allow spark operation anyway. The coils are indeed BC-15A coils, with a nicely made screw arrangement for varying the coupling. Just for show and not for use. 73 - Mike

Actually, that post card in that photo must be a repro - not at all like the original I remember. The original does not have those borders, nor is it so perfect. -

No, and it does not need to be. You asked about the photo in general, I expanded some on the postcard, the rest is a mismatch from a collectors various accumulations.

The transmitter is indeed interesting. Looks totally original to the time, but, a little difficult to decipher. I assume the bottom unit is like a VFO or driver, and the top is an amplifier. Yet, both units use a type 202 tube. There is also a microphone there, does that go with it? What is the item in the middle of the bottom unit? It may be some sort of adjustable coil, but, initially, it looked to me liked a quenched gap. So, anyway, what is the big deal? 73 - Mike

Thanks Mike,

No, I was asking if the photo rung any source bells.

There is also a microphone there, does that go with it? Probably not.

What is the item in the middle of the bottom unit? Self-controled HI-C osc. tank coil.

So, anyway, what is the big deal? As you said, "The transmitter is indeed interesting."

Anyone else?

Bookmark this site:
http://www.ietlabs.com/GenRadHistory/Experimenter/genrad_experimenters.html

This is an online collection of the "General Radio Experimenter"
published by the General Radio (aka "GenRad") company in the 1920s and
30s. The scans are crisp and while the content is aimed at test and
measurement, it's well written and illustrated and I can guarantee
you'll find something of interest - and probably even learn something!

Thanks to my friend and metrology guru Fred Olsen for passing this one
along.

It is indeed well built, but for me if those lower knobs are not "National" (and they don't look like it) I'd find it hard to believe it was something that was built at the National factory. An easy review of other parts like the tubular capacitors would also tell you if they were the same manufacturer as used in other National products from the 1930's.

Another area is this would have to be pre-HRO or 1934 and earlier. The IF can style is later post HRO introduction. Since the placement of the tuning units below the chassis was done for stability reasons. Attempting to place the tuning plug-ins above the chassis wouldn't make much sense to the National engineers.

So I agree Lou nothing points to a National prototype, just a well built receiver that uses a great deal of National parts. At least the seller alludes to the fact it might not be a prototype.

Miss your meds, Lou? ;-)

My own take is that the seller descibed the set honestly, but this doesn't mean his conclusions are necessarily correct. I agree with Don that it's unlikely (if not impossible) to be a prototype because it uses the square IF transformers, and the 1st HROs used round IFs. Also, octal tubes weren't commercially available when the HRO was designed in 1934, and the progression of tube styles used in the HRO series went from 2.5V pre-octals -> 6.3V pre-octals -> octals -> miniatures -> Ge transistors (in the HR0-500 - yes, I realize this isn't a "tube style!").

Interesting set; from the looks of it it probably used the HRO junior electrical design verbatim, except for the coil set, which is 80M bandspread - only general coverage coils were avalable with the junior. I was falling in love with it and found it increasingly difficult to suppress my bidding finger, so I closed the page!

Well, you have certainly helped me spend a bunch and have less living area at the same time. Although, the other night I wanted a rare Telefunken spark key real bad and as I was watching the seconds count down, I entered $1300, but, waited to push enter and started day/night dreaming, and by the time I realized what I was doing, there was only 5 seconds left, needless to say my bid never made it, so, the key sold for a little less than $800. I was really pissed at myself. 73 - Mike

Well, a number of items from your earlier eBay Alerts ended up here. My habit is self sustaining now... I search, I find, I watch, I bid, I pace the floor waiting for delivery. The very first thing I do every morning is rush to the computer to see if anything I need was listed while I slept dreaming of projects. Is there a program or half way house for antique radio addicts?

The octal tubes in the set date it to at least the later 1930's, especially the 6V6. The NC-100 series of receivers dating from 1936 was the first built by National with octals, and they used 6F6's in the output. The plug-in coils are built into National PB-10 base-and-shield assemblies, shown in my 1938 ARRL Handbook. Also, at least according to Raymond Moore, the square IF transformers showed up in the HRO in "variation 4" which came out in 1938. And the earliest resistors visible are "body-end-dot" variety. The early HRO used resistors built into white ceramic tubes, much like the bodies that RFCs were wound on.

So it's certainly not an HRO prototype. It's probably a nicely-made home brew receiver from the later 1930's.

From: N1BUG
Topic: 2177 Message: 2177

I am very grateful to many members of this group for education, encouragement, and assistance in finding parts! I haven't had so much fun in years!

I'm still a bit baffled on resistors. This has become a major focus. To date I have not seen a single 1920s vintage resistor of suitable value to be useful in my project(s). That was not unexpected; I knew they were scarce. I've been thinking about trying to make reproductions or reasonable facsimiles, but I simply don't know enough about what the real deals looked like. If anyone can help with good pictures and dimensions of real vintage parts or would care to share information on how you got around such issues while more or less maintaining that period appearance, I would very much like to receive them. Specifically, I am interested in:

10K resistors for transmitting grid leak

25-50 ohm (or 50-100 ohm center tapped) resistors for filament circuit
I thought about using vintage Christmas bulbs here... they're plentiful, but the sockets apparently are not!?

Any info or ideas?

I am currently disassembling an early radio for parts. It has many early parts like hand painded bug solid resitors.I will check and see what is there. It may be from the early 30s as it has indirectly heated tubes (3 of 56 tubes and 3 of 58 plus an 80.with a later style glass) but the parts and quality are unusual.

If the bodies of the resistors are a solid color, with one end a different color then your dealing with the older "Body-End-Dot" type. They are not to be trusted for value or any thing else electrical. The only ones I have found from that era that are worth anything are the ones with the Lead ends. Most of these are "metallized" and seem to hold their value reasonably well. Test them all!!!!!!

Mike,

That FB-7 with a built-in power supply sounds quite rare. You should post some pictures of it to ER or to Bill Fizette at the AWA. I have a "regular" FB-7 on the air and a rusty FBX up in the attic that I plan to get to one of these days. The FB-7 has a Heath QF-1 Q-multiplier helping it out, so getting the FBX going is a little lower priority.

I carried the FB-7 home to New Mexico from Associated Radio in Kansas City via an airplane flight to Flint, Michigan. It rode with me as under-seat luggage on Southwest 737s. It was well worth the trouble.

Jim -

I have had my share of FB-7s, and FBXs over the years. Sold most of them along with extra coils at Rochester about 10 years ago. Had three extra radios that went to a local collector. Still have an almost mint FBX, that I used to use regularly in the AWA contests. I have a complete coil set for it, in original case (could also be a homemade case, not sure), plus an extra coil pair that I never found documentation on. I believe I got the complete coil set from Bill Gould's estate. (Now there was another great ham and collector and a overall wonderful human being. He and Leah visited me a few times when I still lived in Manassas, VA around 1977. I also visited him once up here in Jersey, just great people.) Of course I also have the one with power supply built in left. I am not interested in ER or Fizette, and doubt if Fizette would know anything about it even if it bit him. We had lots of arguments over early National stuff close to 30 years ago, and turned out I was always right. He should have kept playing pharmacist as he was probably a lot better at it than at radio/electronics. Wow, sounds like I am bitter, but I am not, just saying it the way I feel. After all, that is part of the reason this forum was formed. I would trust Paul Bohlander's opinion a lot more, but, sadly he is no longer with us. I'll take some pictures one of these days and post them on here. BTW, Joe Cro has seen it among several others, and all agree it is factory made, but that is as far as it goes. 73 - Mike

Type 56 and 58 tubes would indeed indicate early 1930s. Inderectly-heated
cathode tubes did exist in the 1920s, though; the 27 and 24 are common
examples.

I rescued four. Two long ones two short ones.
I am severely colour blind but it appears to be back end red dot , blue body for one long one and one short one. Other seems black end red dot Orangeish body. just a moment I will measure.. They are right here. the blue are both 8 K, the one short orange is 50K, the long is 10 K.
I wasnt planning to use them myself.I am working on a UX201A regen. I am not happy with how it works and have been playing with several things. Today I was playing with resitance in the Plate /Tickler circuit. I had these lying around so tried them as well. So far the 8k was the best working. I am a long way from the end on this. This has been a real challenge. I tested till I got plate voltage around 45 but it wants a bit more which is why the 8k probably worked better. Right now I have 332K in the circit for 45 volts on the plate. I am going to try it a 60 and see. I also am learning about grid bias on direct heated tubes. One way the filiments are hooked gives -2 volts. (Not enuf I think.) The other way give 0 volts. Not good. I am thinking it should be -5 to 0- 7.5v . Also adjusting the filment voltage changes the grid bias even though the bias should be neg in respect to the cathode (B minus) the heater votage bothers it. It would not be so with a indirectly heated tube. When I build a TNT which is a similar circuit in a way I build resistance divider network with two resistos and apply the grid cathode to the centre of that so I am not feeding the grid return to only one side of the heater /cathode deal. I am wondering since the regen circuit is much more senstive would it benafit from doing this as well.Only one way to find out. Try it. It wont cost anything and will just take a few minutes to try it. (tomorrow) More and more I am convinced some of these early (00, 01 tube)regen circuits were more accident than planning. I can hold my finger a certain way which proabably affect capactiance and resitance and get it to work well but to duplicate it in the circuit is hard. A lot of the early ones had varicoulers or similar. Now I am begining to understand why. I have had resitance accross the tickler. Resance feeding the tickler and now have var-capacitor throttling the feedback. So far I a m notsatisfied wth how it works. One of us will succumb here. I will either figure it out or go nuts. I am hoping for the former. In my other life that is how I worked. It turned out good there. (Race engines) Study try retry rethink try again start over. When you get through you learn a pile of stuff you never would have otherwise but it is frustrating none the less. However the frustation is temporary the knowledge learned is for life.
Anyway I have these resistors and I am not using them. (I think I got off track a wee bit)

Oh I didnt know that . Thanks Larry.I thought indirect would be only 1930s. I want a proper vintage station. So I need to use pre 1929 tube for my rx to go with my UX245 TNT TX. Otherwise with my heritage (de) I would feel I was cheating. The 56 or 58 tube would not qualify then being 1930s. I may do one with them for fun later . After I get the 1920s station running like I want. I have a ball with my 30s/40s station. I expect the 20s to as much fun or better.

Hi again Don,
  All those years of heating and possible overload has probably changed the pigment. In all other respects the color code was the same as modern resistors.

I was the one inquiring about resistors, so I should comment. :)

I have not yet been able to determine when that type of resistor became available. If I were to make a wild guess, I would say sometime in the 1930s? My primary project is a '29 TNT transmitter, and I'm trying very hard to use only parts that were authentic for that period... or reproductions that look period appropriate. I've seen many of these "body-end-dot" or "dogbone" resistors for sale, but passed them up since I think they came along later.

I have a number of somewhat lower priority projects in mind, including a '29 regen receiver.

I think I may have to put these projects on hold for some time, but I will be back to them!!!

73,
Paul N1BUG

I rescued four. Two long ones two short ones.

I am severely colour blind but it appears to be back end red dot , blue body for one long one and one short one. Other seems black end red dot Orangeish body. just a moment I will measure.. They are right here. the blue are both 8 K, the one short orange is 50K, the long is 10 K.

Hi Don,
Being color-blind can be a hindarance in ham radio, sorry. I have a cigar box full of those old types and should throw them out. IMHO they are worthless. The newer types made during WW2 aren't a whole lot better as they nhave absorbed a lot of moisture. There was an excellent Hints and Kinks about them some years ago in QST. I don't use them anymore. My personal preference is the Tin Oxide types. There may be differing opinions on the issue. Good Luck.

As I said I had no interest in using them . Just mentioned them because if someone needed them they are available. I have a commercialy made pre 20s regen here. it has a gridleak resistor made by several feet of resistance wire not unlike found in a toaster.I measured it with my quick cheap analog meter and no needle response but it only goes to 100k and most resistors there are in meg ohms.
If you think colour blind is bad for ham radio at least i can get my wife to tell me the colours. In my other hobby I build and drag race vintage style cars. Three yellow lights and a green is tough for a colour blind guy. I am far too slow to get a red for leaving too soon. I discovered by accident that nightdriving glasses change the colours and I am able to distinguish them easily even though they arent what they are intended. Now I leave on the last purple before the blue light comes on.
It is tough though. I have several times built circuits and they didnt work. When she came home I would have her check the colour of the resisitors and what I thought was green she says was brown. Still looks green to me but the ohm meter agreed with her . It seemed to fix the problem too. Now I measure them all and keep them seperated in drawers marked apples , oranges , lemons , and Kiwi.

I was bad. I did wind up using one as it happened to be the right value. I had not intended too but why not. I have the single stage triode regen working now. I think it is ok now. I will try listening on 40M tonite.if i can copy some stations around 7040 I will be good to go. Big challenge, this 20s regen with no audio stage so to speak but it works now. If anyone is building one pse feel free to ask . This was one of the hardest builds to get working satisfactorily I can remember. I think because if you were building a set for broadcast band listening that is much different than 40 M CW. With a 1825 tube single triode and no audio stage everything has to be right. Values needed are different than for a modern 1930s and later tube.

> adjusting the filment voltage changes the grid bias even though the bias
> should be neg in respect to the cathode (B minus) the heater votage
> bothers it.

This should not be critical with a regenerative detector for 2 reasons:
1) it isn't a linear stage, and 2) most of the grid bias voltage is...
(drum roll please...) grid-leak bias - i.e., bias voltage developed across
the grid-leak resistor by drawing grid current on the positive half-cycles
of the signal on the grid.

> It would not be so with a indirectly heated tube.

True, but it's a regenerative detector so the grid bias from this source
isn't critical. If it's an RF or audio amplifier stage you'd have to worry
about it. There were two common solutions: 1) use a C battery for grid
bias voltage, or 2) return the grid circut to A- instead of ground/A+.

> When I build
> a TNT which is a similar circuit in a way I build resistance divider

> so I am not feeding the grid return to only one side of the heater
> /cathode deal.

You don't need to worry about it in an oscillator for the same reasons you
don't need to worry about it for a regen detector. The only reason for the
cathode return center point is to eliminate hum when the filament supply
is AC, which you could only get away with in high-level stages (audio
output or transmitters).

My advice would be to just look at the way the ancients implemented 201A
regenerative detectors in the 1920s, and follow their lead.

Thanks. Once I got it working well it is as you said no difference in perfomance even though there was a difference in measured voltage.(I am curious old fart. I try everything several timres to see what happens and be sure my conclusions are real..) The set is now working pretty good. It is not good on hand cap but it is a usable set and pulls in not bad signals. It is different to run than my other regen. Takes more patience. It also needs more antenna. I think this station will be my last directly heated sets. I just dont particularly like them. That said I wasnt going to let it beat me. It could use probably another turn in the tickler but it works and is in range of the cap so for now I will leave it alone. It has strong volume considering it has no audio stage per say. Certainly usable. It has razor sharpe selectivity. Someday of I have nothing to do I may build it with a modern triode just to see how much difference there is. Same schematic just different tube.
Things I would do different.
#1 I would build the set with the smallest PF variable cap in the tuning circuit I have. I would optimize everything for that small range of freq (maybe 150 kcs) I only use them on Cw and having 2 mcs coverage available is pointless.
I would use a larger trim cap on the antenna coupling. Sometimes I have this one screwed down tight almost.
I would use a larger variable cap in the throttle regen circuit. The one I have just barely does it. I wold like a bit of a cushion besides HOWEVER fixing the above problem may take car of this one too.
I need to make a proper batery bank /battery charging unit for power. I have decided afer many experiment that while a regen will run on Ac power supplys it is twice the radio on DC. .It is not hard to come up with a good dc supply bank with the right voltagrs It just takes a comitmentto spend the gold. 10 12 volts gives 120 -138v depending on charge level. A 12 can run both rx and tx filaments with a reo for trimming voltage. The rest will power the rx and then some and the tx as well.
I wouldlike to have an adjustable grid leak with a 3 mego pot and a 250 pf variable cap. I think I would learn a lot ore about gridleaks then.
Don VE3LYX
I am going to that site now.

OK
tube socket is a reworked Ceramic light base. A 45 tube socket I had fit in it perfect.(For me it had to be Ceramic.)
The coil (tickler and tuning) is wound on a solid wood dowel. 1 1/4 and as you can see is mounted right on the back of the tuning condensor . The upper condensor visable in the photo at the top is the regen throtttle. The lower is tuning and has a single plate trimmer made with it with a through shaft and tiny knob in the middle of the main knob.
To the left of the lower tuning cap is a 25 ohm reostat (radio shack or source part # 2710265). On the solid copper leads to and from it is a 330 K resistor . Just a safety deal since I smoked the first one I bought with another different number tube. It doesnt do much but has allowed the reo to live so far so I am leaving it in. Just the tiny extra current accross it saves it and yes I have had that offending tube back in several times since I installed it. Just visable is the homemade RFC to the left of the tube. Works fine. How do I know? I can touch south of it and there is no effect on the radio. North of it it drops the regen.
To the right a flash of yellow. That is holding the antenna trimmer . It is your normal ceramic deal with a bracket mount. I glued the block of wood to the base after mounting it and it is accessable to me from the front with a small screwdiver. Also to the left beside the RFC is that ancient resistor I added. It seems to keep the circuit from overloading or bottom line the radio works better with it than without. I tried many values and arrived at this using a voltmeter to monitor plate voltage and my ears to tell me when it was working well.
Not much to it. It is almost scary but it works and is usable for CW copy which was my goal.
I may try RFC in A battery supply someday. It is getting a bit of RF there as my hand affects it when I touch the A battery leads. Not a big deal but something I mighht investigate later. Right now I am pleased to sit and listen to its sweet beeps as I copy CW . It has been a hard deal to get it working at a useable level . I used it early this morning again and it is working well now.

2212. Hand Capacity help

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-28 22:47:33 UTC
From: Don
Topic: 2212 Message: 2212

I have on this set a vintage cap with a through shaft tuning a sigle plate in te rear of it. hand cap with the main dial is mnor but when I queezed that little tiny centre knob for fine tuning wh0000000000000000000P! The long metal shaft with its tiny knob was transferring my hand capacity to the set. I told my XYL I needed something non metalic. This afternoon she went through a bunch of crochet hooks and found me one of the right size in plastic. I had to scrape the raised lettering off it and some hold grips but it slipped in the centre hole and tightened up, I hunted till I found a knob of sorts to fit it. It works. No burp at all when I tune it now. It is a bit stiff so I guess I need to clean it up with some 600 grit paper to remove any minor burrs but it did cure the hand cap thing big time. It you have that type you alrady know what I am talking about. Little by little the set improves.

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-29 21:14:57 UTC
From: Louis Vermond VA3AWA
Topic: 2214 Message: 2214

I was just looking through the group photo section again. I enjoy seeing everyone's projects and prizes. Since I will likely never meet any of you in person, I especially enjoyed the few pictures of group members. I wish there were more. It's nice being able to put a face with a name. 73, Paul N1BUG

Paul, what a good idea!

I have created the photo album, AWAGroup Member Mug Shots. Anyone can up-load their photo to it. A first name and call photo ID would do. Sitting at your OT station, for example, would be an added touch.

Paul, will you be the first?

73, Lou VE3AWA

I like the idea and the name of the photo album, Lou! :-)
I will contribute a mug shot. Let me see what I have. There aren't many in existence... people seem to place some value on their cameras?!?!? Unfortunately it won't be me sitting at my OT station... yet.

73,
Paul N1BUG

OK folks... BUG mug shot uploaded. Horrible picture taken with a web cam. Not sure if that makes it more frightening or less so. Anyway... if I'm brave enough to share this awful thing, then you can all upload one, right? :-)

I will replace it with a better one when I find something better.

Me too! Don, thanks very much for uploading yours. Lou also, nice update. My, how you've changed! :-)

For reasons I won't get into, I don't get out much. It's very enjoyable to "meet" folks in this group, and the mug shots add something extra special. I hope more will join the party.

I will upload a better picture soon. Maybe me sitting behind a pile of vintage parts... until I get them assembled into a station.

I've been licensed since 1981. Spent a lot of time in my early years tuning 80 and 40 meters looking for signals with chirp or buzz... hoping to get another QSO with a vintage station. For many years I have been mostly DX oriented, working everything from 160 meters to 70 centimeters, including EME (moonbounce).

But there was always something about those 1920's rigs! I went all googly-eyed every time I saw a picture of one. I saw and touched a real one once... owned and built (in the 20's!) by a friend. That was almost a spiritual experience. :-) He became a silent key not long ago. Sure wish I knew where that rig ended up!

I am downsizing my station and was looking for less expensive aspects of the hobby to pursue. Long time friend and mentor Ron, N4GJV, told me about the Bruce Kelly event. Say *what*, Ron??? People are building *and using* '29 style rigs!? I knew I was hooked right away. This isn't exactly less expensive, but it sure is intoxicating!

Sorry, got carried away. More mug shots, please...

By the way... eagerly awaiting second shipment from PTOP... a step or two closer!

73,
Paul N1BUG

Having built my last regen from scratch using no particular schematic and info from here and there , now that it works I am getting brave. I have an old 20s radio cabinet. I made a face plate today and a wooden chassis . I have a three gang variable from a 1930 set (56 /58 tubes.) I am building a Regen using the already mounted (just did it) three gang. One gang will be a passive tuned circuit feeding a standard triode regen feeding with its tuned circuit on the same variable , next set of plates. That will feed an audio amp and I may add a second audio stage. (Maybe one of the 58s)On the right hand side of the variable I am building a TgTp also tuned with the same variable (grid tank) but the last section. Seems so simple now but I know it wont be cause life doesnt work that way. It will be fun though. One main tuning. I will have a seperate variable for maxing the tx plate circuit but no more spotting to get on freq. Next I will mount the vintage tube sockets and start making the three identical tuning coils. I am thinking 80M so i can talk to Lou again but with no rocks.

Great ideas, Don, but I think you'll go nuts trying to get the TX to track
with the RX - the frequency of each will be affected by the antenna
circuit/loading, and to different degrees. You MAY be successful if you
can figure out a way to use the exact same tank circuit for the TX and RX,
but then you'll have the complication of switching the tank circuit
between the TX and RX. Another idea would to have a small "trimmer"
variable capacitor that is switched in for either TX or RX, but not both,
to compensate.

Good luck and keep us informed!

Went to my first Ham Flea market today. Been licensed sine 80 but never had the chance before or didnt know when they were would be more correct. . Got up early a drive 2 1/2 hours. Arrived at 10. I felt real "welcome." About like a Rabbi in the Vatican. I felt like the invisable man. Eyeball Qsos were being held in front of the TCA booth and everywhere else I wanted to visit but I did find some good stuff. A set of US army hi impedance early phones for $15 in good condition. A knob and dial for use on my TNT. It isnt quite what I want but is much better than what I had and the price was right. It do for now til I find a bakelite one.(Or pour one myself after making a mold from the rx one) The guy selling tickets to the draws seemed to get real busy when we came by so we missed all the draws which by the way were all done by 10:15 despite the fact it was an all day event. Found a guy who said he had 100 s of Crystals. He didnt have them with him but might bring them to Smith Falls (another 2 1/2 hour drive) I tried to arrange to buy them from him direct but I got that blank "who the H are you stare" so I gave up. I ll just get new ones or something. I dont care about the price within reason. Anway it wasn't going to happen with him. Not the best day I ever had but I have now crossed it off my bucket list of things to do.
I did get a super deal on three Vintage National Verniers. I was very happy with that. I did learn one thing. Whenever I see another ham I will always talk to him and be friendly. If I dont know him because he is from far away or not in my circle of friends I shall count that a bonus and rectify it immediately. If ignore him (or her) or am rude may my hemoroids be on fire!

Don - How far are you from Rochester NY? (I assume not too far with a VE3 callsign).If not too far, you should come to the AWA conference - usually a lot of good vintage parts in the flea market there, and we'd get to meet each other.

I also hear the new Rochester Hamfest (held in June I think) is a good one.

Liked the Regen and TNT pix, by the way.

2235. Open letter to Don about fleamarkets:

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-02 21:22:42 UTC
From: dpetersen tds.net
Topic: 2235 Message: 2235

Hello Don and the Group:

Ah yes...the infamous "Hamfair fleamarket". Don made mention that he felt as welcome as a Rabbi in the Vatican. Don't fret, Don - they all seem like that. Fleamarkets are impersonal things. The guy behind the table is there to sell stuff and you are there to find treasures. Usually he is not there to chat. When I am selling and I have a dear friend come by the conversation usually lasts less than a minute. Don't take it hard. We both know what we are there for. The ones that irritate me are the two old coots in their electric wheelchairs parked in the middle of the aisle chewing the fat. Stops the flow faster than an LA freeway at 5pm. The vast majority of buyers will comment to one another in a friendly fashion so don't be afraid to make a nice comment to someone else. I carry personal business cards to hand out if we want to communicate further.

Lot of crystals at his home? Hmmmm. I would want to see them. For every usable ham crystal there are fifty in the 6 to 9 MHz range (except 40 meters). About as useful as high heels on a giraffe. I *have* generated a signal on 160 meters using two crystal oscillators and mixing them but that's about it.. Same for that "big box of tubes" he has at home. Do you know how many vacuum tubes for old TV sets are out there? If it starts with a number like 27 or 11, cruise on. Fortunately tubes for AWA era stuff are easy to spot but are getting pretty rare.

Don 't forget under the table. This is where the term "Spider hunting" comes in. The crappier looking the box the better your odds. Nitrile (exam) gloves are handy to keep your hands clean and to avoid creepy-crawly bites. I once found a half-rotted box under a table that had a lifetime supply of Meissner plug-in coil forms. Got the whole thing for two dollars. After I cleaned off the dirt, bird droppings, and fossil spiders I had pristine looking coil forms.

So don't fret. When you are at a fleamarket you are joining a fraternity of Neanderthals looking for prey to kill and drag home. It ain't a cotillion. 8^)

Have fun!

Thanks felows. I will suck it up. I am an old hand at flea markets. Automotive, I even was a cattle buyer for a few years. (Now there is a dangerous exicting way to make a living!) No time for chit chat there. You have about 5 seconds to make a $1000 decision.Still made a lot friends. Of course that is after the sale. There are NO FRIENDS at an auction. Today I wasn't trying to visit. I was trying to buy. Anyway so be it.
Maybe I should just get to work making a good VFO for the 50L6 rig. I have a few rocks , 3555 3561 3686 3579 and I did have a 3642 that I was going use with Lou but somehow I have misplaced it. Drives me nuts I cant find it. I had it right here. I am currently blaming the cat. I would like a few more between the 3555 and 3595.
The one in the pic(the tx) is a tnt (40 M) so no rocks required. The new one will be TPTG so it will need no rocks either. After that I want a AM rig. Started out with a Viking II Then everyone wantred to sound like Donald Duck . Now a bit of sanity has returned.
On the way home I stopped at Princes Auto and found four more 12 gel batteries. $10 each. I have 5 now. I want ten . Then I will have a good rechargable DC supply, up to 120 quiet volts, for my vintage style rigs. I will be singing my new song then. "Charge all Day, Talk all Night, Dit Dah, Dit Dah"

Thanks. I intend to participate with this set of radios.
As for the AWA accross the lake I live due north of Rochester in Pr Ed Cty Ontario. I may get there sometime this year. I have a vintage dragster and have been asked to show up near Rochester for a meet. I would make it a double whammy and visit the AWA museum too. My wife has cousins near there. I am scheduled for a visit to the Hammond Museum next friday in Guelph Ontario. It will be interesting as well.

The headphones turned out to be a great buy. They had some mold or something on them but the XYL gave me a short course in disinfection and cleaning so after they dried I tried them on the 6SL7 regen since it has the phone jack as well as pin jacks. They work very well. I am pleased. I painted the centre of the new dial i bought that is on tx black. Same diameter black as the rx dial. It looks much better. They had an HRO style dial there too but the shaft size is to big for what I was using.

There was a 40mc Phone set military at the Iroqouis fleamarket for sale. He had a British number for it but said this one was Swiss and the manual was in Swiss. I thoght well that is German Italian or French . I had the two outside ones covered so I looked atthe manual. It was I believe Swedish. Being able to communicate in German I was able to read most of it as there is some similarity in the language although you have to have an open mind. It looked like a decent radio in good shape. Retangular and well built with rounded corners. he had the handset too. I think he caled it an 80 set but said that was the British or Canadian designation.I think what he said was "We call this an 80 set. " He was asking for $75 but said "Make me an offer." I am in my homebuild mode so I wasnt tempted beyond curiosity. Also the 40Mcs did not turn my crank. I get nervous above 14.2mcs. Whether that is similar to what you a re asking about I dont know. Same freq though and was a Miltary phone set.

eBay has been very boring of late. Besides, my search list has narrowed to just a few items now, so the hunt doesn't entertain me for more than a few minutes each morning.

By the way, I miss our daily eBay Alerts. Lou? Maybe eBay really *is* boring lately?

So I decided to go through my pile of Sangamo mica condensers and test them. That didn't go very well. I thought I had a way to measure the capacity, but it failed to provide consistent results on the old condensers or on new parts. So much for that. Next I put each of them across a variable power supply and slowly cranked it up to the limit of the supply, 320 volts DC. One or two were shorted but most showed no measurable leakage at that voltage. Which brings me to my question of the day...

Other than shorts or high leakage, what goes wrong with these? I'm wondering how likely it is that some which passed the 320 VDC test may actually be bad in some way?

I've used many old(ish) micas over the years, but never bothered to try scientifically testing them. Let's just say in the application(s) I used them, bad ones point themselves out very quickly. :-)

73,
Paul N1BUG

By the way, I miss our daily eBay Alerts. Lou? Maybe eBay really is boring lately? Yes, pretty slim pick'ns Paul.

I bought a cap meter off eBay several years ago from a Taiwan source for $12 and reasonable shipping charges. Works well and great to have for such work. Think about it.

I had thought about making something to test caps used in Rf circuits. I thought a simle osc circut and sub the caps in the tank and chect the frequency on my Dgital Dx394 After that it is to the charts or do the math. I never knew you could have a cap meter for that little gold. Now I wonder why I dont have one. I am going to look tomorrow. Speaking of Ebay I just bought some crystals . 3530 3535 3560 3575.611 (??????) That will fill a bunch of my holes. I will have 3530 3535 3560 3561 3575.611 3579.45 3686 and if I ever find it again 3642. That should be enuf. I can rubber them to as I have a small VXO circuit added to the tx . The tuning knob is one of my violin pegs (from one of my other hobbies, fiddle making) coupled to an ant trimmer ceramic cap. I figured tuning is tuning.

Hello Lou,
FB on your cap tester. I got a nice digital LCR meter directly from China for the paltry sum of $18 and change shipped to my door. I did a few tests and compared it to my $100 LCR meter and it's right on the money with the more expensive meter.

The reason for this post is like you, I wanted to let others know that capacitance testers and LCR's need not be expensive. I'm sure your meter is pretty kewl in it's own right. We have to speak about it sometime.

BTW, I too greatly apprreciate your ebay alters. You come up with some pretty good "stuff" from your searches. Please keep up the good work!

Best regards,
Joe Cro N3IBX

Wow, that's nice Mike. I found kit and assembled C meters available in
Canada at prices under $20. Also some cheap ones from China. I like
the AADE more though. It would be great to be able to measure L too.
Now to decide between going el-cheapo or waiting til I can afford nice.
Bought too many vintage parts! :-)

Both of those resistors are with high probability from the mid 20's or so. It should be easy to tap the wire wound one with a thin/narrow copper strap around the center.

Regarding "non-inductive", the answer is the wire wound will work fine as those were what was used back then. Besides, the inductance will be small enough not to be an issue and the Q will be almost nonexistent because of the resistance being relatively high. Additionally, the filament is at ground potential with minimal RF on it. 73 - Mike

No. The resistors are for the DC power return so any reactive component wouldn't hurt and actually it would be beneficial that they did provide some RF choking affect (RFC). There are typically two mica caps that are used for the RF (or high frequency AC if you will) return from the filament leads in a tube that doesn't have a separate cathode (directly heated).

Thanks everyone for the information on the resistors! I'm thinking about using them in pairs for the filament circuit. I have a few of each. The measured values are not all the same but I can get one closely matched pair of each type from what I have. I'm also hunting for C6 series burning Christmas bulbs, as I would like to try that too. My list of variations and ideas I want to try is getting rather long! All part of the fun. A project just wouldn't be a project without a certain amount of experimentation.

I'm getting quite close on parts for the TNT now. A few bits still to scare up, but it's coming along. I need to get busy ordering brass hardware, solder lugs and such.

Paul -

On linear length, relatively small in size, variable wire wound resistors, a sliding sleeve over the resistor element is what was typically used, unless it was a fixed tap wire wound resistor either in center, or, at some other desired place. That is why I recommended you just making a tap of your own on one of those tap-less wire wound resistors, but of course, two closely matched will work as well.

It appears I am not the only one who sometimes, not always all, responds without reading previous post to a question to see if there were answers that covered the question adequately. When I do, I usually just keep my trap shut. You had about a half dozen other replies after I posted my reply, so, they must either think they know better to repeat the same info, or, they were not aware that your question was answered. Regardless, this way you have a quorum. 73 - Mike

Mike,

A few comments...

I am intrigued by your idea of adding a tap to these resistors. Keep in mind, though, the ones that have exposed wire are 25 ohms, so that would be only 12 ohms or so each side of the tap. Too low? Also, I'm not sure how much power they can dissipate safely. Assuming I eventually manage the upgrade to a '10 tube (probably unlikely, but I can dream!), that would be 2.25 watts dissipated by the resistor. Perhaps I will put one on a variable power supply and do some testing.

The others are 100 ohm resistors. Theoretically one might be able to tap those if the label were removed, but it would be a shame to rip that pretty label off. Besides the actual winding on those is very short, which might make getting the tap narrow enough and centered well quite challenging.

I apologize if my post generated too much traffic in the group! I try not to post every thought or question I have for that very reason. I will add, however, as still a relative newcomer it is nice to receive a number of replies. It makes one feel very welcome and provides a sense of encouragement. I have been building for 30 years but must admit to some self doubt on these vintage projects, especially after my attempts at cleaning parts went poorly.

Paul -

Traffic on the group is always a good thing. Sometimes there is none, so do not worry about that.

I agree with your conclusion. If the open wire one is only 25 ohms, on a 5 volt filament it will dissipate 1 watt (E^2/25=5^2/25=1). That may get a little warm, but, not more than that resistor can handle, as being that size, and wire wound, even 5 watts would probably be OK. None the lee, for what you are trying to do, in my opinion, a 100 center tapped would be a better choice. Remember, it does not matter too much how much your home made sleeve in the center covers, as if it covers a little too much, lets say you wind up with 80 ohms total, or, 40 on each side, that will still dissipate a lot less power, and get the job done equally well. Of course, if you do get a 2.5 volt tube, your resistance value can go down by 4 for the same power dissipated in the resistor. 73 - Mike

Subject: Re: [AWA Group] Re: resistors (Thanks)

Mike,

A few comments...

I am intrigued by your idea of adding a tap to these resistors. Keep in mind, though, the ones that have exposed wire are 25 ohms, so that would be only 12 ohms or so each side of the tap. Too low? Also, I'm not sure how much power they can dissipate safely. Assuming I eventually manage the upgrade to a '10 tube (probably unlikely, but I can dream!), that would be 2.25 watts dissipated by the resistor. Perhaps I will put one on a variable power supply and do some testing.

The others are 100 ohm resistors. Theoretically one might be able to tap those if the label were removed, but it would be a shame to rip that pretty label off. Besides the actual winding on those is very short, which might make getting the tap narrow enough and centered well quite challenging.

I apologize if my post generated too much traffic in the group! I try not to post every thought or question I have for that very reason. I will add, however, as still a relative newcomer it is nice to receive a number of replies. It makes one feel very welcome and provides a sense of encouragement. I have been building for 30 years but must admit to some self doubt on these vintage projects, especially after my attempts at cleaning parts went poorly.

Paul N1BUG

On linear length, relatively small in size, variable wire wound resistors, a sliding sleeve over the resistor element is what was typically used, unless it was a fixed tap wire wound resistor either in center, or, at some other desired place. That is why I recommended you just making a tap of your own on one of those tap-less wire wound resistors, but of course, two closely matched will work as well.

It appears I am not the only one who sometimes, not always all, responds without reading previous post to a question to see if there were answers that covered the question adequately. When I do, I usually just keep my trap shut. You had about a half dozen other replies after I posted my reply, so, they must either think they know better to repeat the same info, or, they were not aware that your question was answered. Regardless, this way you have a quorum. 73 - Mike

You are going about it right Paul. I built mine just to see if it was any good and wasnt too fussy on original parts. It works perfect so now I wish I had been. I did have an original NOS UX245 tube in its original box and a ceramic twist base so i started off good. Variable cap is not right for 20s nor are the silver micas. Once i got it going and there were no hitches whatever I wondered why I ever built a crystal controlled rig. All the best on your build. I am looking forward to the pics and then I hope a QSO.

Don -

Aha - well, so far you got two recommendations for the AADE. It is a great little instrument. Guarantee you will not regret it. It will not measure high value electrolytics, but, almost any antique C meter will do a good job of that, as well as rejuvenating, which I have often done. 73 - Mike

Don I think there is something to be said for building a rig with whatever parts one has at hand. Many tried to encourage me to go that route, and they had a good point. I could have been hands on having fun some time ago. But I had a mental image of what I wanted it to look like when completed. Being stubborn as a mule I have stuck to the hunt for vintage parts. Actually the hunt has been exciting in itself. It is fun to spend weeks doing daily eBay searches for an item and suddenly it shows up. Nothing gets the heart pumping like the last few seconds of an auction for an item you just have to own! Of course nothing thins the wallet like it either. :-) I think I'm actually going to miss the hunt when everything is said and done. I look forward to a QSO with you and many other members of this group.

Stubborn is good although I prefer determined. My XYL would tell you I am somewhat of a professional at that. She has a sign she bought on the wall . (Living with a German builds character.) Whatever that is supposed to mean. How did she know ? We even respelled the name! I know you will have a wonderful rig. It is a really interesting design. I wish I had come accross it earlier in life. I used a pair of 100 ohm resistors on mine BTW. I have been really tempted to try that on my regen too. Then again it is working real good , Maybe I should just leave it alone. What will you be using for a RX with that?

I may have to use a (very) modern receiver at first but will soon be building a regen. The detector will be similar to yours using a 201A. I will be adding one stage of amplification using another 201A. I have been collecting parts for the receiver and transmitter simultaneously, but looks like all the parts for the transmitter may be in hand before all the parts for the receiver. Actually I got a little (more than a little???) carried away, as I found other parts during the search that I just could not pass by. I tried to pass them by... but failed! Consequently it looks like there will be more than one '29 transmitter being built here.

The 01 can certainly use a audio amp. I was a man on a mission when I built this one and was committed to trying just one triode. It works but would be a much better radio with an amp. However i wanted it and now I have it. My 6SL7 regen feels like an R390 Collins after running the 01 set.
Thereis a real thrilll to making a toal vintage QSO for me. Farthest I have made was near Mt Vernon NC from here in Belleville on the north shore of Lake Ontario. Lou and I had a go at it too and were successfull although noise wise it was a terible night. I have been preoccupied with the 01 project but now that it is working I put my heater battery back in the cabinet for the 6sl7 regen. I have ben tryig to work 3561 a few minutes each day but so far no replies. I am going to give it a shot again later. This building these sets is addictive. i think i need a bigger house! Anyway I will be waiting for your debut with the new TX.

My furry beast would much rather steal things than lay around! I spend as much time chasing him to get parts and tools back as I do working on projects. The little bugger can really run!

Had one years ago that used to lay on top of my NC-300 receiver for the heat. Every time I left the room he would reach down and give the tuning knob a spin.

I would like to share a few things I have learned the hard way about regens if I may.
Number one is do not use too big a variable cap in the tuned circuit.Since we are building them for ham use the amount band we need is very small. Even a 100pfs is big. I have one here I have removed 1/2 the plates from and could still throw away half that again and have more coverage then I need.
The smaller the range you need to tune over, the better and easier your receiver will work. You can optimize it better.
The lower the frequency the more feedback required. Sometimes the spread is so large infFreq it is hard to get regen on both ends of the dial.
Yes you can do it. That is not what I am saying . I am sugggesting that you will be spending time getting it to work on a freq you will probably never use.
I used to make them with plug in coils. I dont anymore. I am using them on only one band so why bother. If I need another band I build another set. which is part of the fun. I have one on 80 and one on 40 .
The 80 is a mid thirties to late forties style as is its tx. The 40 M is a 20s style set with a mate tx
I plan to build a minature tube set later too. Both tx and rx but that wont fit here so pretend I never said that. (I have had several 12ax7 regens in the past. They work very well.)
The circuit I have found to work the best for early tubes up to octals is the twinplex . It uses pot regen control.
If you are worried about Hv in the headphones bang your head against a brick wall till such foolish worries leave.
A regen works best on a loop ant.
It gives the set stabilty they dont have otherwise and eliminates any TVI etc no matter how minor.
When setting up your set a good trick is to know if you are checking if is it working touch a scewdriver to the ant cap coupling cap . If you hear a click it is working. If not, it isnt. Often loosening the antenna coupling (less cap) will fix that. Input is easily overloaded.
They are very sensitive . Even on batteries you can hear the house wiring when no signalis present. Do not be surprised if they hear stuff you cant hear on your big commercial rx. Some designs like the twinplex are just flatout that good.
I use mine only on Batteries anymore. i can hear so much more . Otherwise I get to listen to Ontario hydros 60 cycle and that does nothing for me.
A good regen is twice the set on battery power.
A bunch of 9 volts snapped together will run a long long time. These I have are almost 3 months old and doing fine. The regen is the most used rx in my shack.
Heater battery is the one that dies quicklyand I charge mine every couple of days.
Gridleak for earlier tubes can be higher than for later ones. 3 to 4 megohms seems pretty good for the 01 tube. I tried several till I was happy. From 1 meg to 6.8 megs.
Earlier tubes need more tickler winding.What would swamp a 6sl7 or a 12ax7 would barely get a 01 awake.
With real early tubes (01s 71 etc)the throttle cap regen control works better than a pot but you need at least 100pfs and more is better. .

Just some things I have gleaned from my experiments over the years.
Don VE3LYX.

Since you guys are discussing this openly, I'm going to assume you don't mind eavesdroppers.

I tried to listen last night but was quite distracted by one of those "gotta have it" auctions ending at the time you guys were trying! Yep, I got it. :-)

2306. Readrite Set Tester

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-05 23:54:36 UTC
From: Leonard Meek
Topic: 2306 Message: 2306

I have an old Readrite Set Tester Model 710A that I would like to restore. It's probably not worth the effort, but it seems to be complete and it would be a shame to destroy it. So far I've only been able to find data on the model 710. The 710A is similar, but has an octal socket and a combination 5 & 6 pin socket, plus the 4 and 7 pin sockets. The jacks and switches are different too. Would anyone have a copy of the schematic they would be willing to sell?

Leonard

578C signal in Maine Don! Nice show. Nothing heard from Lou yet. My 80 meter transmit antenna is kaput due to storms, so I wasn't able to call you. My stupid solid state rig hates high SWR. I'm surprised to be hearing you so well since most of my receiving antennas are down due to storms and falling trees also.

Paul N1BUG

Thanks. I had dinner with a guy from Maine>
I didnt hear Lou either but he is off the end of my antenna. When the weather gets decent I will put up a better one. This one is wound through the bushes here at about 6 or 7 feet up. Wish yours was up. My Cw is rusty but there is only one cure for that. Do more of it. I am going to check the distance now and see.Lot of traffic tonite. It was hard to find an opening. Had to wait for them.

Probably not the best night working east west but we will try again. I wonder if we tried earlier would we have less traffic to deal with? Maybe I messed up here to although I did use my marker to set the receiver and put the rock back in the tx afterwards.I copied W0KX and KA1HFN working away. They were a hair above us but I could hear them. The one lads tx was trying to die on him. Anyway We will do it again. Till we get it . If it was my error I apologise. I recheck everything in the morning.

Don I'm not sure I would mess with that antenna. It sure sounded good here. As soon as the two to three feet of snow in the woods melts, or we get a hard freeze so I can walk on it, I will do some antenna repair. I wish I had been better prepared tonight. I wasn't expecting you to be so nice and clear here. Next time I will be ready so I can make a recording of your signal.

And Lou... ditch the Air Gap sockets! You must be going right over us with that last mile! ;-)

I checked with my marker osc this morning. Right on freq so you must have been powering right over me. We will try again. I willl be out for a few nights. Got a meeting tonite, Fiddle playing tomorrow nite and will be in Guelph Fri (Hammond Museum 1 pm appointment). Sat I am in Fort Erie till afternoon then back here. If it isnt too late and I am still concious maybe then. I will post a warning first.
My marker osc I made from a 7400 chip because it is a quick and simple circuit costing zilch (oder nicht) I clip the choosen crystal in the alligator clips
(just like on your fixed air cap deal , same ones exactly) I made it so the face of the project box which is aluminum is the radiator and point it toward the ant or set and squeeze the button . i tune till it is right and then put the crystal in the tx and i am good to go. I still swing to be sure but return to the setting I had. Last time we worked (and I counted it.) (Not our fault we got over riden by QRM and QRN. We did very definatley have a contact and a good portion of a CW QSO.) You were right there exactly. I didnt even breath on it. I think last night was conditions. My ant may have a lower angle seeing as how it is built. I am quite surprised it actually works like it does. If anyone saw it they would die laughimg.
Don VE3LYX
Now for the big question ! Are they alligator clips or really crocodile clips?

Thanks, Lou. That's what I was looking for. Unfortunately, they want payment by Paypal for membership and they want a lot of personal information to prove I'm a collector. While I have accumulated a lot of stuff over the past 70 years, I don't consider myself a collector, and I especially don't like Paypal. It's probably not worth the effort, but I like fixing up old radio equipment and making it work again.

Hi, Mike. My only experience with Paypal was a few years ago when there was probably less regulation on credit cards. I got a flood of spam on my email, some of it demanding payment for stuff I never bought and threatening legal action. I haven't had any trouble since I changed my email account, but the wounds have still not healed.

Subject: Re: [AWA Group] Readrite Set Tester INFO!

Thanks, Lou. That's what I was looking for. Unfortunately, they want payment by Paypal for membership and they want a lot of personal information to prove I'm a collector. While I have accumulated a lot of stuff over the past 70 years, I don't consider myself a collector, and I especially don't like Paypal. It's probably not worth the effort, but I like fixing up old radio equipment and making it work again.

Len -

I, along with probably everyone else got those types of spam. I just ignored them, and all was fine. It is a lot better now, so, you may want to give it a try again. If you like, I could buy the manual for you using my PP account, and send it to you. Regards - Mike

Hi, Mike. My only experience with Paypal was a few years ago when there was probably less regulation on credit cards. I got a flood of spam on my email, some of it demanding payment for stuff I never bought and threatening legal action. I haven't had any trouble since I changed my email account, but the wounds have still not healed.

For what it is worth, I love PayPal. I have been using them from the beginning and never had a problem, and, I spend a lot through them. They saved my ass so far on over $20,000 between several unscrupulous ebay sellers who were paid by me through PayPal and they never

delivered. PayPal refunded me 100% on all items every time, and went after the sellers themselves. Also very convenient for international transactions. Regards - Mike

From: N1BUG
Topic: 2339 Message: 2339

I'm looking for information on the original standoffs used to mount the velvet vernier to the Type DX condenser. I believe they were 5/8" long? Were they M/F threaded or just a hollow spacer for a long screw to pass through? Hex or round? Width?

I'm on something of a tangent here (again), but while I am ordering hardware I am interested in exploring whether there is a reasonably close equivalent available today.

Hi Joe,

You can try, but I've found that with my el-cheapo Radio Shack-brand portable frequency meter it's rather hard for it to get a proper "lock" on the frequency of some of these self-excited '29 rigs...

Those OT outfits can be just a tad too unsteady, in many cases.

I agree with Lou in that a well-calibrated receiver goes a LONG way to actual frequency read-out...but the frequency meter sure can be handy by times when you're in the initial "groping" stage of testing a new/old rig, & haven't a clue WHERE in the spectrum you might be generating RF...!

A frequency counter would probably be OK, if the gate time was kept real short, so that nothing past the KHz digit shows. In other words, set the gate time so that only X.XXX is displayed. More digits than that will be confusing. Even here, the least significant digit will probably not be stable, but, it will be in the ballpark, especially on average. 73 - Mike

Hi Lou,

That technique will work alright, but you have to do a LOT of spinning of the receiver dial---and then more re-spinning!---to locate the signal. Still, it works A-OK, if there's no freak-meter on the premises...

BTW Lou, are you going to the Spring Meet next month...? And for that matter, is anyone else going to be there...? I hope to do so this year, after a forced absence for the past two...

Hi

For my 40m inverted Vee, for the radiating elements if I were to use twinlead 300 Ohm instead of single bare conductor, and simply cut one conductor of the twinlead on each side of the Vee for 20m, and the other conductor cut for 40m?

Would there be any disadvantage if instead of using 300 Ohm twinlead I were to use low cost 22ga clear untwisted speakerwire, not breaking the webbing between the parallel conductors?

Would this work? Has anyone tried it? Or would it be a waste of money?

As Lou had said, a calibrated receiver works.

However, if you are running an OT receiver, it's calibration may not be accurate or precise enough, of if a regen, it will usually be "blocked" by the strong local signal. I use a WWII military surplus LM-5 frequency meter (similar to the BC-221), in these cases. Not from the 20s, but the method is, and it's one heck of a lot more OT than a frequency counter (if that matters to you).

>

That works. I have done it. It can be a little tricky getting the length right for the higher band. In addition to the usual variables it seems to be influenced somewhat by the presence of the other wire. If you are looking for low SWR you'll probably have to cut it a bit long to start, see where the SWR dip is, and then make another cut as appropriate.

> Would there be any disadvantage if instead of using 300 Ohm twinlead I were to use low cost 22ga clear untwisted speakerwire, not breaking the webbing between the parallel conductors?
>
> Would this work? Has anyone tried it? Or would it be a waste of money?

I tried it once, years ago. Never could get low SWR on the higher frequency band. My guess is the conductors were too close to each other. Your results may vary, as not all speaker wire is created equal.

Of course if you are going to use this only with vintage rigs, SWR may not be of prime importance. ;-)

I tried it with TV twinlead once, and never could get the SWR on the
higher-frequency band below 4:1 or 5:1 (it was a long time ago). I agree
that the problem was probably that the wires are too closely spaced. I
am using real ladder line as feeders on my wire antennas now, with
balanced-output matching networks in the shacks, and I'll never go back.
But I'll bet the two-band antenna would work better if one was to use
the ladder-line I'm using for feeders to build it - the cunductor
spacing appears to be around 4 inches.

2351. Eddy & Robson's Question

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-08 16:30:45 UTC
From: Louis Vermond VA3AWA
Topic: 2351 Message: 2351

That technique will work alright, but you have to do a LOT of spinning of the receiver dial---and then more re-spinning!---to locate the signal. Ur retired Eddy, what else do you have to do?

BTW Lou, are you going to the Spring Meet next month...? No, but it wud be good to meet you again. Lou

No doubt. We built a 80/40/20 meter version for the club station once, using home made spacers with the wires about 3 inches apart. Compared to my twin lead experience, it had lower SWR and broader SWR bandwidth. Of course, different location and environment may have played a role in that. It didn't hold up to ice and wind too well, however. :-(

Niel,

Thank you for this information. It's probably ridiculous to worry about such minute details, but since I have to buy spacers anyway, figured I would try to duplicate whatever they actually used as close as possible. I won't need to worry about a panel, so it looks like 5/8" spacer and 3/4" machine screw would be perfect.

Time to go cook some more variable condensers! :-)

Because, one wire cut as a center-fed half-wave for the lowest-frequency band of interest (in my case 160M) can then be used anywhere up through the 10M band, with minimal loss.

No need for traps (which eventually fail in the WX) or other multi-band tricks (like the one we were discussing) which can get messy, especially if you want more than two bands from it.

For me, it's a no-brainer. Others may have other priorities.

From: Niel - W0VLZ
Topic: 2283 Message: 2356

Jim,

I use my station transceiver (an almost antique ICOM 735) to make certain the transmitter is on frequency and then I get my SW3 on the same frequency. See my "Station Tuneup" youtube video at http://www.io.com/~nielw/1929Stn/1929Station.htm for a walkthru demo. I then leave the station transceiver on frequency as my code/frequency monitor.

During construction/initial testing the transmitter "VFO" coverage is so wide that getting it on frequency is usually just a matter of swishing through the entire range, locating the signal and then trimming the coil so that the band of interest falls close to maximum capacity.

I radiate a signal from my signal generator and beat it against the received signal, then use a freq counter to determine the exact freq of the sig gen.

Hi Guys,

OK, let's have a quickie straw vote here, i.e., WHO IS PLANNING ON BEING AT THE AWA SPRING MEET THIS COMING MAY...?

I had to miss the past 2 years due to circumstances that were totally beyond my control, but this year I'm hoping to have my slate clean, my pennies saved, & my car all gassed-up & ready to roll to Victor, with the XYL in tow.

So...who can I reasonably expect to see there with me & of a like mind, partaking in all the goodies, fun, & mayhem that is Spring Meet...?!

Paul,

I checked inside my Browning-Drake receiver which was manufactured using the type DX capacitor with the mounted velvet vernier and dial. See http://www.io.com/~nielw/browning_drake/BD_Rcvr.htm for kit version documentation.

B-D used round/hollow/unthreaded spacers. The exact length is dependent the front panel. The vernier is mounted on the front of the panel so the spacer length had to be adjusted to take panel thickness and the length of the DX capacitor shaft into account. Obviously, in the case of the Hartley with no front panel, the spacer does not allow for a front panel thickness but still has to be correct for the shaft to fit properly into the vernier. The bolt head is covered by the dial scale so it is not real visible. A slotted (not phillips or hex) round head bolt should be correct for the period.

My inclination is to say it's unlikely to be a tranceiver - more than likely, it's a receiver and transmitter on a common frame.

To be a tranceiver, one control would set both TX and RX frequency, and one or more of the RF stages would be shared between RX and TX. I don't think that's what we have here.

Nonetheless, it's very cool, and that image is a keeper. Tnx Lou.

When did Hammond start? I always thought that Fred started the company, whom I knew fairly well through AWA meets. However, in today's mail, I received a packet from Andrew Nolf that had two Hammond catalogs, the earliest of which is 1934 (G-45). I know Fred was considerably older than me, but, that would still make him pretty young in 1934 to start the company. I still have a couple of AWA hats that he gave away to some select AWA members many moons ago. Regards - Mike

Unbelievable. From the very first days till right up to Kenwood TS830S (I felt right at home then.Got one here)
There were early broadcast sets. A lot of Ham radio gear and even some of our stuff. One and two tube regens and a couple of TNT txs, one a push pull (pair of UX345)one single tube. I took a few pics of those ones. A huge key collection. Also a Deutsche section with some models of the Volksempfanger which I was always curious above. If you wanted a better look or a picture it was instantly avialable. Lots of vintage Collins stuff to. My dad who is still kicking was a Collins Design Engineer in the 50s/60s so I always had a soft spot for that stuff. Lots of HROs and other National, Harmmalund, Hallicrafters, Johnson and Heathkit. Even some Eddystones. I was there several hours. Could have spent longer but the XYL seemed to think we needed to go antiquing in St Jacobs. Since she never even squeaked once at the Hammond Museum I felt such good manners should be rewarded. Sure was an interesting experience. Next one is the AWA museum.

When did Hammond start? I always thought that Fred started the company, whom I knew fairly well through AWA meets. However, in today's mail, I received a packet from Andrew Nolf that had two Hammond catalogs, the earliest of which is 1934 (G-45). I know Fred was considerably older than me, but, that would still make him pretty young in 1934 to start the company. I still have a couple of AWA hats that he gave away to some select AWA members many moons ago. Regards - Mike

I will do that Lou, and I could also have Google'd it, but figured some of our Canadian brothers could shed some personal knowledge to whatever I would find, so, I started here first. You indeed did that by sharing that you had lived in the house were the Hammond Co, started. That is really neat. No wonder you got a few electrons in your blood. 73 - Mike

I took down my 1 week old antenna and I rebuilt it all last night, stayed up until midnight.

I couldn't find any 300 Ohm twinlead to save my life, so I ended up using....yup....Speaker wire again!

So using some PVC pipe and plenty of speaker wire, I made a 2 band inverted Vee, cutting each antenna to it's calculated length.

At the end of the 20m antenna I'm suspending it below the 40m antenna with a 2ft long piece of PVC. Seems to tune up fine!

Managed to make 3 QSOs this evening on 40m with it, got 10 over sig reports out to South Carolina and Iowa but just an S7 out to Arkansas. TONS of QRM this evening on 40.

I'm only running 120 watts into a tuner. No additional power amplification here.

I'll try 20m in the morning and see how it goes.

Not lots. maybe two more. I was kinda absorbedin the tour. A bit overwhelmed perhaps. There were three levels. Stuffon display. Stuff behind displaya bit , stuff on secondshelf and stuff on the floor underneath. When I said thousands of old radios I believe that is an accurate discription. I have here reportedly the first SSYV unit ever built in Ontario built by Sid Horyne and some of hos plas. Reported working condition. I acquired it years ago in a trade with another ham and often thought about cannibalizing it. I couldnt do it since I thought it has some significance and was going to donate to Hammonds museum (AWA accross the lake did not sow any interest, I offered it to them a few years ago.) I am afraid Hammond just flatout has no place to put it.

Hi Don,

Do they still have the two Collins KW-1 transmitters there...?

When I was at the museum on the occasion of the AWA off-site get-together years ago that Bruce was referring to, Fred had one of those behemoths on the air, & he offered the mic to me---but I declined...I suddenly got mic shy! (probably overwhelmed at the mere site of it all).

Fred also had a diversity set-up of RCA AR-88 receivers there, i.e. the kind they used in Camp-X. All KINDS of treasures & rare birds, including a spark tranmitter that Bruce Kelley fired-up on the spot!. It was a most memorable day for me...

And at the end of it all, Fred called us down for sandwiches & pop. What a nice guy he was---a true gentleman.

Yes they are still there. I had to check out the Collins stuff as Dad will be quizing me as he is a former Collins Design Engineer. (Aircraft Radio) There is a lot of Collins gear there. But for me my heart is in the stuff I took the pictures of. I live for the glow of a single tube regen and single tube tx working in the dark (Like my Youtube video "Ham Radio After Dark") I was thrilled to see they had some of that there. My XYL saw the old Lamp radios where the radio was in the base of the lamp and she is now on a mission to find one. I hope she does!
RE the KW-1. I would probably have chickened out too. I am not the most relaxed operator anyway so would also have been very nervous. Still you probably kick yourself ocasionally when you think about it now

Not much Ham actvity on 40 tonite but I tuned into the shortwave stuff and was surprised how loud the signals were considering this regen is single stage 1 triode . Loud enuf to occasinally hurt your ears.. Tis a tricky little set to run though. But I will leave it as is since I believe it is a good representation of what would have been typical back in the day. First I tried it for non ham shortwave broadcasts.Very selective.

I got a 0 - 500 R.F. milliamperes meter that didn't work. It was inoperative and it measured open. Hmm, it's dead, might as well take it apart and have a look. It took some time and 10X magnification to see the three breaks in the thermocouple. That is some mighty thin wire. My guess is either someone put way too much power through it or maybe nature did. :-) Anyway I somehow managed to bridge the breaks with solder. Don't ask how... I'm not sure. I think luck had a lot to do with it. Surprise! It works. Accuracy is off by about 30% but it gives a relative indication. That brought back memories of projects past. It must have been 20 years since I performed surgery on a meter. Now to find some entertainment for the rest of the day...

Paul -

You were indeed lucky, for several reasons. Most thermocouples used in meters, even the early ones, had them enclosed in a glass bead. Your thermocouple was obviously open to free air. That is usually bad because they can easily oxidize. The other is, that you did not damage the thermocouple with heat. BTW, how do you know that it is off by 30% ? One would think that thermocouples could be calibrated with DC, however, for RF that is usually not so. Regardless of any of that, congratulations on the fix, and, now you have a good relative indicator for tuning up. 73 - Mike

Mike,

I very well may have damaged the thermocouple with heat. That may be why it is 30% off. The wires are a bit shorter now due to bridging the breaks with solder, but I'm not convinced it is enough to make for that much error. I put the meter in series with the center conductor of my 160m coax feeder with a known wattmeter also in line. I ran a few watts through it at a frequency where the impedance is nearly perfect 50 j 0 and compared meter readings, doing the math to convert between power and current of course. There are various errors that no doubt creep in here and there, so 30% is an approximation of the error.

If I can find a good 0 - 500 meter I will use that instead. But they seem to be scarce. I feel lucky to have this injured one!

Well, indeed if you really had a 50 +/- j0 to use as a reference at the operating frequency, then that is a good method of calibration. Remember, 30 % is only about 1.5 dB, so, I would not worry too much. It will still play just fine for tuning up. Nice job. 73 - Mike

Thanks Mike,

I'm pretty confident it is very close to 50 +/- j0, however I do plan to revisit this test in a few days using a decent RF load. I left it at the repeater site and I'm too lazy to drive there and get it today. At least I hope that's where it is!

Hi Don,

I haven't been there for a coupla years now (the last time I attended it was at the Iroquois arena in Whitby), but it's still surely one of the bigger venues for us VE3-types...

Only trouble is, "bigger" seems to translate to "bigger prices" in the minds of a lot of the vendors!

That's why I much rather prefer the smaller get-togethers. Still, if you've never been there, make it a point to attend, even just this once. It's always fun to go to a Hamfest no matter the size...

I don't know if insatiable curiosity is a desirable trait or a shortcut to insanity. ;-)

After "fixing" the RF ammeter yesterday I starting doing some research on such instruments. Somewhere along the way I ran across this, which I don't understand:

http://cgi.ebay.com//380320513841?

I don't want it. I just want to *understand* it.

Radio frequency current squared at first implied the 0-100 scale read the square of the r.f. current. But if so, in what units? It says Res = 5.2 ohms, so this surely can't be amperes squared, or 10 amps full scale? Milliamperes squared makes more sense, that would be ~316 milliamperes full scale. But it says I=115 MA. I'm confused. I see what I believe is the same instrument in a 1934 Weston catalog, but that doesn't clear anything up. All it says there is "Model 425 galvanometer, 115 MA 5.2 ohms". Can anyone educate me on this thing, please?

73,
Paul

Well Paul - I am not certain either. I would have thought that the 5.2 ohms & 115 ma were the characteristics of the basic meter movement. It is possible that it was intended for use with an external thermo couple. With regard to the I^2 units, the only thing I can think of is that since it states Thermal Galvanometer, it may be measuring heating power, which is then proportional to current squared. I do agree with you, not much of it makes sense. Especially the fact that the scale is so linear, and, units are not even given for the scale. Is it ma squared, amps squared or what. The guy sure wants a lot of money for something that may not even work, HI. 73 - Mike

Subject: [AWA Group] RF galvanometer?

I don't know if insatiable curiosity is a desirable trait or a shortcut to insanity. ;-)

After "fixing" the RF ammeter yesterday I starting doing some research on such instruments. Somewhere along the way I ran across this, which I don't understand:

http://cgi.ebay.com//380320513841? <http://cgi.ebay.com/380320513841?>

I don't want it. I just want to *understand* it.

Radio frequency current squared at first implied the 0-100 scale read the square of the r.f. current. But if so, in what units? It says Res = 5.2 ohms, so this surely can't be amperes squared, or 10 amps full scale? Milliamperes squared makes more sense, that would be ~316 milliamperes full scale. But it says I=115 MA. Thanks Mike.

It is a curiosity. With most of the RF ammeters / millimeters I have or used to have, the stated resistance is that which the overall instrument presents to the circuit in which it is placed, so I was looking at it from that mindset. Clearly this is a very different instrument. For whatever it's worth the 1934 catalog doesn't mention an external thermo couple. But it doesn't give much information of any kind about this thing so who knows. I agree with you about the price. If it was really cheap I might be tempted to buy it just to find out what it is, but not at that price. I'm being very selective lately, only buying things I actually need to get started on building projects. Which translates to buying nothing, HI.

73,
Paul

Thanks to Lou I now have matching and period correct knobs on my vintage 20s station. My old knob looks a bit grungy next to the new one so I guess I will have to figure out how to repaint it. They do match nicely though and are mirror numbered which really appeals to me (Alles in ordnung)
Thanks Lou

I fixed the other one. White out works great. Smear on rub off with fingers. , How did I drill it? I went to the shop and was going to used the lathe. Thought the mini lathe would be best but that little voice inside said "Don, it wont survive." I have learned to pay attention to that voice so I made a nest for the knob in blue styrofoam and drilled it on my drill press, a tiny bit at a time very gently, holding it still with my hand just in case it caught it could spin (it did several times.) It took me about an hour but it fits and works fine. I just wired up an Ac powered PS to run it. I have a bit more to do but I might have it on air tonite. If I am close I will post the freq . I have fogotten where its happy spot is. So even if no one has 40 M rig and ant they may at least hear the old thing. If I dont post before 9 pm it will be another day.

OK, I am good to go. All tuned up on 7030. I will give it a test at 9PM if that frquency is clear. If not I willl wait for an opening. I will be on a very short time so will send a test signal V V V from VE3LYX. A lot of unknowns here so I al keeping it to an absolute minimum tonite till I am postive all is ok. I am mighty nervous too. I will be on the mate regen but am going to have the dx394 running too. Anyway I am commited (or maybe should be) to try it. It lights an 11 watt bulb to bright orange so I am guessing 4 to 5 watts top. I took the loading coil off my 80 M antenna . It should be good as the length is right and it worked great as a 80M ant. I made an inverted V today for 40M but couldnt find my right insuslators. My younger brother Dan (Former Bell Tel guy) said he would install it whan I am ready.

Hi,
Be sure to use a pan-head or something similar as the round-head
type machine screws might interfere with the back of the dial.

Roger.

Don, is this a bakelite dial? I have some here to be restored but am afraid to touch them after many warnings that paint or anything applied might seep into pores in the bakelite, making it impossible to remove any excess that got in the wrong place. Just curious...

NO I was feeding it direct. I got ths to work on my 80 M rig so I had hoped it would work here. I did get it loaded up later but SWR is not good. Through meter says 3 watts output. I played with it some this moring too. Yesterday I had tuned up on my dummy and then switched to the antenna. I hadnt tested the antenna and when I went to try it would not load. It is an invertered L .When I switched the leads of the coax around on the ant coupling coil later it worked but I think the SWR is too high for any decent actual output. I have a better meter and will check it later today. This one has seen some smoke years ago and is not accurate anymore. I am probably pushing it a bit being over anxious and all. I will check everytthing later today and may whip up a cap for the antenna circuit.

Bakelite is impervious.
Bellevillle was bakelite central for Canada. In fact they just tore the plant down a couple of years ago. My brother in law and his brother in law worked there (last one was the big chief for awhile) The white-out worked like a dream. I smeared about a 3/4 inch section at a time, waited about 30 seconds and then rubbed the excess off with my fingers . The white out stayed in the numbers and lines perfectly. Hardest part is getting the whiteout off my fingers.
One thing I have learned with the wonderful exception of this group is most expert warnings come from folks who have never tried anything and are not really experts but just "drips under pressure".
I will get the bottle and give you the brand.--------LIQUID PAPER

I tuned it up on 7064.5 which is off its sweet spot but still functional. I put on my other meter. SWR is not too bad. 1.2 to 1. I guess I really did smoke that other meter! I will be checking further today. I am nervous about my heater suppy. It is max + for this tube. I need to pop a couple of ohms in the circuit to protect it. It is a defective NOS UX245. Defective because somehow it got a 5 volt heater instead of a 2.5. Of course if you had bought it 90 years ago it would seem defective. I thought it was as well but when I checked the heater with an ohmeter it measured double the other 45s values. I checked the heater n my UX201A and it was the same value so with great fear I tried it on 5 volts and it came to life . I know it is hard to believe but no glow at all at 2.5 or even 3 volts. This supply is just over 5 volts which makes me really nervous . About 4.5v gives me peace. How long it will last I dont know. I have three 45s as well but they are not the classic shape. How could this be? I have absolutley no idea but it is so. I still have the orignal NOS box it came in too. If it dies I will switch back to 2.5 v and use one of the 45s

Did you remove the old paint? If so, how did you?

I very effectively did that once when I didn't want to! I used lukewarm soapy water to try to clean a dial. The paint came right off, slick as can be! What little remained after washing fell off the next day when I picked up the dial. I subsequently read one should never use water on bakelite... don't know if that's true but I will never try it on something with painted marks on it again. I have often wondered what invisible damage I did... the dial seemed to lose some of its sheen too. :-(

Paul

Thanks Don. I have to go out and buy shipping supplies this morning. I will look for white out while I am there. Then I will nervously attempt to clean and restore another dial.

Paul

Don Dulmage wrote:

Bakelite is impervious.

Bellevillle was bakelite central for Canada. In fact they just tore the plant down a couple of years ago. My brother in law and his brother in law worked there (last one was the big chief for awhile) The white-out worked like a dream. I smeared about a 3/4 inch section at a time, waited about 30 seconds and then rubbed the excess off with my fingers . The white out stayed in the numbers and lines perfectly. Hardest part is getting the whiteout off my fingers.

One thing I have learned with the wonderful exception of this group is most expert warnings come from folks who have never tried anything and are not really experts but just "drips under pressure".

I will get the bottle and give you the brand.--------LIQUID PAPER

I have everything set up on 7040. Near as I can tell. I have to g out tonite but may give it a quick try about 6 PM if all is good.
I found some insulators and am continuing to work on my inverted Vee.
That is not me up the pole. I hate heights . Looks more like my brother .
Only feedline I like workong on is the one at Tim Hortonsfor brakfast biscuits
Re bakelite. I am sorry someone has scared you a bit. bakelite is impervious. Good quality distributor caps are made of bakelite . I am by trade an auto mech (Class A Ontario and ASE master tech USA.)
In the old days (1960s) When apprenticing I worked with a man who was an acknowledged specialist in tune up. He would take the dist cap and wires , wash them in varsol the wash them thourghly with water blow dry them with an air hose and reinstall. (If they were god of course.) That was back when the object was a good repair and not to sell parts. I, having learned it from him ,did it for many years in my own speciatly shop and while I cant speak for him I can speak for me. Not once ever in my 40 plus years as a mech did I have a failure after doing this. Bakelite is as I said impervious. It really doesnt care what you use on it aside from extreme heat (aka fire(flame)
All the best. I am happy with how mine came out. It rolls off as you rub it but remains in the grooves and numbers.

It could be. I was about to scrap it but decided it check it with the meter. It had me scratching my head for awhile. I wondered if THE NEW GUY had put it tgether using a 201 heater not knowing the difference in resistance as they physically look the same. Doesnt matter though. No advantage or disadvantage either way.

2432. RF galvanometer? follow-up

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-13 23:30:38 UTC
From: N1BUG
Topic: 2393 Message: 2432

Just a follow-up on my question about the Weston RF thermo-galvanometer. I found various short references, bits and pieces mostly. Evidently the 0-100 scale may be fairly linear but the units are arbitrary. Full scale deflection is 115 mA. I get the impression it was used as a sort of early field strength meter. Or at least that was one use.

http://www.wesleyan.edu/physics/history/radiocat.html

Apparently it works on the principle of the Duddle Thermo-Galvanometer. I'm having a bit of trouble finding links that aren't a mile long, but if you google "duddle thermo galvanometer" you will find a patent and other info.

There is a more reasonably priced one on eBay now. I have decided my curiosity is satisfied and I do not need one to study.

http://cgi.ebay.com/350455468437

I obviously have too much free time. :-)

Rats!! I'm not young! Eager is no problem, so I got one out of two qualifications. :-)

Heck, I'd do it just for the educational value if I could. Sounds like fun!

73,
Paul

Hi Lou,

If it was a simple one day jaunt, there & back, I'd say let's go for it...but the XYL & I plan on using the Meet as an opportunity to kinda "...get away from it all" for an over-nighter up in Victor. You know the routine, i.e. "Two's company, three's a..."

Well, you get the point, I'm sure...sorry, OM!

How come you & your better half aren't coming this year...? You seemed to have a ton of fun when I saw you there the last time a coupla years ago. Wo' hoppen...?

Following is the information on the AWA Spring Meet as it appears in the April Journal. Unfortunately the April Journal will not be mailed out in time to give timely information about the meet.
Marc Ellis

AWA SPRING MEET

May 7

At the
Bloomfield Elementary School

just
around the corner from the AWA

Museum
complex at 6910 Rts. 5 and 20 (intersection

with Rt. 444).
Opens to sellers at 7:00 a.m. and

the general
public at 8:00 a.m. Inside tables and

outside
spaces are $7.00. No registration fee.

AWA sale
and auction. Presentation on

development
of the new museum.

2459. April Journal -- AWA Gateway

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-14 22:13:09 UTC
From: Marc Ellis
Topic: 2459 Message: 2459

To Eddie and the group--

The April Journal will be out at the beginning of May. It has been delayed by the production of our brand new electronic publication The AWA Gateway. Available now on our website www.antique wireless.org, it's free to all. Content is generally much more basic then that of The AWA Journal; it's intended to interest and engage people in our hobby. Recommend it to interested friends. Your comments and ideas welcome.

The Gateway will be a quarterly like the Journal and will be released between Journal issues. Our
timing should be back on track with the release of the July Journal.

I'll send out the information on the Spring meet, j ust as it appears in the April Journal, in a separate posting.

Marc Ellis

After 1/4 million miles on ol' Betsy, last May we drove her to the local wrecker. Creping into their parking lot, The XYL jumped out and ran around in front to stop the car.

After getting our bicycles out of the trunk we rode to the licensing bureau to cash in the plates. The next stop was the insurance agent to cancel our policy. On the way home I yelled out, "FU" to the car mechanics along the way.

No car and now 5K a year in the black(er).

That's what happened. Lou

Speaking of Reg I discovered that a station the direct outgrowth of egs wok with alternators instead of spark gap was built in Sweden by the same fellow who made Reg's unit and operated on a daily basis until 1999. It is still fired up once a year on schedule and on special occasions and is now a Unesco world heritage site. If I keep healthy and the gold doesnt run out I am going to visit it some day. I was assounded that an rf producing alternator would be servicable into this era but it is. Long story how I discovered it for me. I supppose some already know about it.

Yes, station SAQ on 17.2 KHz. I have tried to receive them on my old RAK, but so far no cigar. I don't have a proper antenna for it - I was trying to use my 160M dipole as a top-loaded vertical wire. There's a lot of noise in that part of the spectrum.

Thanks. I know what you mean . Some days have a bit much in them. I have no problem if you come back with the modern stuff of course I am learning modern is a relative term. At the Hammond museum there was a KNWD TS830S on display . That is what I have and here it is in an antique radio museum?!.
Anyway I will be pounding brass tonite as well after 7 pm to around 9 off and on. A reply or signal reprt would be great from anyone. SWR is now about 1.2 to 1 and ouput is just over 3 Watts . Set has settled down since I put the reins on the filiment voltage. I hope it is getting out but will not know till I hear. I am going to install a flashlight bulb tuner in behind the panel. I have one on my 80M rockbound set and just love it. I made a hand held one for this set when I built it but I would like it to be a permant fixture. They are so handy . I am recharging the regen battery now. That set is so quiet you can hardly tell if it is working and yet I hear signals well. I dont know if it is just weak in audio or that tube is a quiet one. Anyway I copyed a few CW rigs . Average as the crow flies is around 370 to 380 miles although I did copy F5IN last week. Anyway have a good day and hope to see some on the band. Maybe we should have a vintage net going. One for rocks and one for warblers . Net control and a check in once a week so we can keep our stuff up and running. On 80 M and on 40 M. It would take a few minutes per week. (Not weekend so we dont run into CQ CONTEST(GRRRRRRRRRRRRRRRRRRRRRRRR!!!!!!!) Say every Monday night at 20.30 EST. Just a thought. Just net call and check in just to "keep the rust off"

Yes. Apparently he was in the USA and when Reg's design was built he was who built it. I think he was working for GE but I am going from memory. Later on he did much on hs own including that station in his homeland. I am often in Deutschland so with a bit of planning and determination I could get to Sweden to see it. Not this trip (may 12 to 23) but maybe the next one. I wonder if there are other similar sites. I am going to the Technik Museum in Sinsheim De this coming trip. I dont know if they will have any radio stuff there but we shall see.

That has fringe benefits too. I lost some excess weight during the two years I did it while saving for a vehicle. After six months I felt better than I had in ten years. I'm a mile and a half to two miles from most of the business in town. It's a small town, pop. around 2500. I'll be doing it again soon if I don't stay away from eBay. It's OK... a few of those excess pounds have come back! :-)

I had a choice. I could, for the most part, spend my days as I wish or get a job to support a car. As the Ford dealer in town who we occasional rent cars for trips said, "That's a no brainer."
Sounds like it. Life is about choices! As long as you're comfortable you made the best choice for you, more power to ya!

No, you were not wrong - you did hear me. I was looking for Don, so I fired up the R390A and Hartley, and was tuning around looking for him starting around 7AM. After about 10 minutes of no joy in finding him, I answered the CQ of a station in OH and had a brief QSO with him, but he lost me towards the end because the band changed and I was only running about 1000 milliwatts of raw power. The Hartley presently has a UX-171A in the socket.

Thanks Larry. I must have heard your call at the very end. You had a decent signal here but the noise and QRM was terrible.

Was that 1000 milliwatts DC input, or was that RF output? Just curious. I would be interested in the operating parameters if you don't mind sharing them. I almost bought a UX-171A a while back, but ultimately decided I will just go with the UX-201A I have until I can afford "big dog" tube like the UX-210 or UX-245.

Hi Don,

Do you live in the Greater Toronto Area, or as it's affectionately known "The 905" district...?

If so, you'd absolutely KNOW that---like it, or not---having a car is NUMERO UNO if you expect to work, go to school, or simply to survive in these parts. City scapes here were planned & mapped-out for the past two generations-plus with the automobile foremost in mind.

Bicyclists and others have only just recently descended onto the scene---the current state of affairs is still more "car friendly" in these parts, than otherwise, for better or worse...this is not Germany, or central Europe. Indeed, I still recall with a smile some years ago when my aunt visited from Lyons, France, & one day proclaimed, "Let's take a drive to Vancouver---I hear that it's beautiful."

Well, beautiful or not, we had to show dear ol' auntie an atlas that confirmed BC was some 5 days away---with steady driving. They just aren't used to that over 'ome...

I envy you, Lou. Wish I could do without a car, now that I'm retired. I was going to get rid of one of them, which would have left me (but not XYL Elaine, who's job is ~12 miles away) without a car during the day during the winter. This would have been fine with me, as I like being a homebody that time of year, spending time by the warm stove working on radio projects. Two things prevented me from doing so, however:

1) My aging mom's situation requires me to take her to appointments (Dr.'s, etc) - typically a couple of times a week. Just got back from one such outing, as a matter of fact. Since Elaine works during the day when these things happen, I'm totally on the hook for it.

2) If the other car goes in the shop, we have no transportation, and Elaine can't get to work. If college son Alex's car breaks, he can't get to class. There is no back-up in either case except for the 2nd car. And, since we drive well-used vehicles, these things do happen from time to time.

I do a fair amount of biking when the WX allows - about 40-50 miles/week in the good WX. (And a trainer indoors when WX doesn't allow). Love it. Elaine & I also ride a tandem together. All mainly for enjoyment and exercise rather than transportation, though, because you really can't carry much besides yourself on the ones we have.

AWA content: there's a 1950s-vintage mobile ham "station" in the 1963 Falcon (my summer car).

RF output. DC input is approximately 3X that (at least). Not very
efficient.

> I would be interested in the operating parameters if you don't mind
> sharing them.

About 300V plate voltage. I'd have to go check the current, but you can
get a rough idea based on what I've said so far ("do the math").

A '71 is "almost" a '45. The guy on the other end probably isn't going
to hear the difference. I wouldn't go above 300V with a '71, though,
and you can put quite a bit more (500V IIRC) on a '45.

3W DC input at 300V. That one's easy even without scribbling on paper. :-)
Thanks Larry. That's plenty close enough to satisfy my curiosity.

I was rummaging around in the shed today and ran across a partial coil of 1/4" copper tubing I had forgotten about. It was a bit discolored but shined up nicely with steel wool. I was worried because it wasn't perfectly straight but had a lot of little irregularities from laying around and having stuff thrown on top of it. I was pleasantly surprised to find with the proper amount of tension while winding and holding the pipe at just the right angle, the coil comes out perfect, not showing any signs of irregularities. I calculated the piece was about a foot longer than needed for an 80 meter tank coil. I had about 9 inches left over after winding. That was close. Not having a proper vise and work bench, my method of anchoring the far end of the tubing while winding involved driving a small nail in the living room floor. (WARNING: builders with risk factors such as marriage should not attempt this procedure!)

So now I had a tank coil. I laid out the major parts on the kitchen table to check my proposed layout. Hmm, not quite what I had visualized. It might work but would result in the transmitter being almost 50% larger than the "classic" TNT. Not desirable, I have very limited space. I tried a few other layouts, eventually getting around to the "classic" arrangement. Hey! The designers knew what they were doing. :-) So much for the dumb new kid's ideas. I will play with it some more. I would still like to do something a little different but am out of ideas at the moment.

I wouldnt worry about the size. Just build it. Mine is fairly big.

If you want it small go solid state. Then you would have to join the "Awful Wireles Group" (I have one of those too. on 3555.) TNT is a bit bigger than a foot square. Lots are bigger than that and quite long too.
When i am making this stuff I tell myself it is 1925 and you are about to build a TX so you can get on the air. Size would be the last thing on your mind . You should know this is addictive. Bet you cant build just one!

Bet you cant build just one!

You win that bet Don! I started out intending to build just a TNT. But of course I quickly realized I needed a receiver to go with it. Between Steve/VE7SL's extremely inspiring web site and digging thru the ARRL Online Periodicals Archive, I soon fell in love with other rigs from the period. Unfortunately I found very little self control during parts buying, so there will be others coming along! I live in a very small house. At the operating position I can accommodate one transmitter of most any reasonable size, but I have to store the ones not currently in use somewhere. Where I don't know. Best to keep them down to somewhere around original size if possible. If I lived in a bigger place I wouldn't worry about it at all.

If I built my TNT with the layout I had in mind it would end up being around 19 inches wide. Funny I didn't see all the issues until I actually laid out the parts and looked at it. I have some non-radio stuff I must attend to this morning. Also want to get out and check the snow/mud situation in the woods to see if I can resurrect some of my antennas yet. Later in the day I will play more with the TNT layout.

I drove up today tot he Pickering Ham Flea market.
It was pretty decent. I got a bunch of ancient knobs an old lightable dial and some 9000UF 50V caps (t see if i can get my AC powered filment supply to SSSHHHHHHHHHH. That is the trouble with a regen. the better it works the more it can also hear the PS which is why mine run on batteries.
I also bought 9 80M crystals between 3542 and 3680 $3 bucks each (CR8 style.)
And then on a weak moment I bought a 24 volt dynamotor for 24 volt to 110 AC. I can see I will be parking my two lawntractors hear the shack so I can steal some power (12v each). 400 cycle should be easier to quiet down when rectified then 60 Cycle. My plan is to use my favourite circiut for power. Transformerless 110 with a voltage doubler. I have two here now. One in use on my rockbound rig and another built downstairs. When the batteries get low I will mow the lawn.(Without being asked! The XYL will think I have finally gotten responsible!)
I passed by a No19 set for $10. It looked like it had suvived a crash landing as the chassis was dinged in on the side but quite repairable.)About 5 minutes in the shop vise. It was an relatively empty spot where it was dinged so no damage electrically . It had a bandswitch missing and no tubes but I know what my Dad would say. He was an Aircraft Radio Wireless Mechanic Instructor for RCAF (No 1 Wireless School)during THE BIG ONE . He helped me as a kid bring some no 11 sets back to life from similar condition. He would say fix the dent. Make sure nothing is broken. Fix anything you can see. Get the tubes and pop them in . Apply filment power . Do they all light? Good that part is ok. Now all you need is to wire in a new switch and check the grid and plate circuits and you will have a working radio.(inch by inch anything's a cinch) But then I thought it was too new for here so I left it. Still for a patient person it would have been a steal.
Don VE3LYX
PS I will be TNTing off and on all day whenever I get a minute. Close to 3541. +or_ 10kc at the very most but as close to 3541 as possible.

Don,

I did get two rocks (2 pairs) the same. Thought of sending you the two spares for your 6l6 rig. (3542 and 3680) Tks for thinking of me, but I'm covered there.

I actually have a set of 80M coils for a tnt. I made a grid coil to see if I could make the beam power rig TNT. Well good. If you've the inclination pse give them a go in ur TNT. If OK, let's QSO on 80 tomorrow at 5PM. Less QRM and skip about right. What sa?

In an earlier letter to me you mentioned wanting to build an 80 mtr dedicated TNT or a TPTG. Although un-named others here will tout the wonders of Hartleys & Colpitts, suggest that you at least try the TPTG before deciding. Just parallel a variable across the TNT grid coil and you've a TPTG. A good sig and, best of all, you'll have another dial to turn.

The XYL is away 'till Sunday nite. Think I have three Blue left so it'll be a Big Drunk tonight! Speaking of which, was at a party a week ago and the host handed me a Blue. Hadn't had one for twenty years and with reason. Don't know what's happened, but it was darn good. Either my taste in beer has improve, I'm such a lush now that I don't care what I drink or, Labatts has an new brew master. Anyway, we're lucky up here. The worst Canadian beer is better then the best down there. Poor buggers have to drink that Eagle *iss.

Probably a dumb idea but could you go vertical.? Coil mounted vertical instead of horizontal

Thanks for the suggestion Don. It should work but probably presents similar issues to the layout I had in mind. Anyway this is of no real importance. The standard TNT arrangement works fine in every respect except for being slightly boring and un-original. I will still find a way to get some minor variations in there!

A whole lot of unimportant rambling:

That antenna coil is the fly in the soup. I had wanted to put the tank coil along the back edge rather than the left side, but that plus the antenna coil takes up too much space with that arrangement, unless I was willing to run wires underneath the coils for the power and key connections. I choose not to do that as to me it seems to violate good engineering practice. It would also work if I put the power and key connections on the side as opposed to the back, but that would be messy with the small space in which I will have this set up. You'd have to see this room to understand. :-)

I had thought about using wire instead of the 1/4" copper tubing for the antenna coil in order to make it more compact. Perhaps supported by wood strips or something. I fail to see why that wouldn't be OK, since we don't have the high current to worry about in that coil. I had also thought of using some mechanical arrangement with a knob out front to adjust the coupling. However, despite all my digging and reading I wasn't able to get a definitive feel for whether anyone actually did stuff like that in '29. If not it would clearly violate my prime directive, which is that the project should use only parts and techniques appropriate to the era. Even if it was occasionally done it appears it was not mainstream, so still pushing the limits of my prime directive.

I put the receive antennas back up yesterday, and got my exercise in the process! Long walk around a flooded area to reach the far ends. Heavy rain, wind, and rising water today, so by tomorrow they should be down again, HI ! Might have to get the raft out for the next repair session. I sense adventure coming...

You have covered a lot of the thinking I have done too. Side rear hookup Practical vrs orignal style. I have made my last coil from 1/4 copper. From now on it will be 1/8 copper. It has been around a long time having been often used for oil pressure gauges (Which is why I always have some. Youa ssumtions are right too. I have a 50L6 tx where the plate coil is normal wire. The thing is about 3 times the power of this TNT and it has absolutley no trouble surviving. I guess you have heard it on air already so you know.
I believe and I may be wrong that a TNT needs a low Q grid coil and a hi Q plate coil. The hi Q is in control then. I wind my grid coils on wood and make my plate coils in air hence the copper tubing. I made a 1K linear many years ago with 1/8 copper. 3000 volts. If it was good enuf there it should have no trouble here. I am making a new one here too for 80 M. I built the 40 for a specific purpose (Museum demo) so i do not want to monkey with it. I hooked up my 80M 50L6 Tx again this afternoon and may pound some brass between 930 and 10 tonite (3561)
The 40M TNt does not like this antenna. Poweris almost 4 times on the dummy as hooked to the antenna. I have a new Antenna going up Monday for that rig so I will save it till I get it upand going. Probably tune it up with the TS830S. Then hook up the fleapower TNT
Anyway we have to build what it right for us. I resemble that idea myself! :>)

I'm not sure if these even had an "official" voltage rating. Any idea what they will handle? My guess is not much. I should have put a ruler beside them. The two on the left have no known manufacturer ID, and measure 1-5/8" overall length. The others are Micamold, body length 1-1/8" not including terminals.

Just thinking ahead toward a possible future project. Another idea presented itself while I was playing with parts layout for the soon-to-be-built TNT rig.

Paul - I have a mess of these as well but like yours, none are voltage rated. Since they are 'receiver-service' style caps I suspect that they would have to stand-up to at least 300V so were likely rated higher yet. Perhaps some destructive testing is in order! Maybe someone else knows for sure.

Not sure about manufactured voltage rating Paul - but in any case you should check them for current leakage on a cap tester/analyzer. I have a couple Sangamo 600v mica caps that show leakage around 50 volts - even though the measured capacitance is close.

Thanks Steve UV and Steve SL,

Now you've got me questioning how I tested these and other old condensers. Lacking a tester designed for the purpose, I put each across a 0 - 320VDC supply and brought the voltage up while looking for leakage current. What worries me is that not one of some 30+ vintage condensers showed any measurable leakage. Hard to believe. Perhaps the method is not valid? What worries me even more is some of them have an 'XX' scratched in the back. The only purpose I can think is someone used that to mark defective ones. But if so, whey keep them?

I'm going to go test them all again using an external (and more sensitive) meter to detect leakage.

BTW, the small ones seemed to have no problems with 320VDC in the short term. Whether they would survive it in the long run I don't know. Maybe I should leave one on the supply for a week. :-)

73,
Paul

In a mica cap, I would suspect that the leakage is more due to the package than to the dielectric (mica). So, that could possibly be remedied, by just placing it in an oven for a while. The mica dielectric could easily handle 600 volts. Those are so common, that as VE7SL suggests, it would be educational to just break one open, check out the construction, and mike the dielectric thickness. In the early days they used mica as the dielectric for the capacitors used in spark gap transmitters and they not only had to handle very large voltages, but, extreme current forces as well. Even I can tell stories of my attempt to build a capacitor using glass plates for a SG transmitter. I sure broke a lot of glass in the process. It was just amazing to see the pressure on those plates of glass as the voltage was increased. When I used them impregnated in an oil bath, as soon as voltage was applied air bubbles would start coming out from between the glass plates. Eventually, the pressure got to be so great, the glass plates would just shatter. I had to finally refer to a book by Steinmetz to understand all of what was going on. I finally did manage to make one that worked, and it did not need oil, but, very thick glass. 73 - Mike

Not sure about manufactured voltage rating Paul - but in any case you should

check them for current leakage on a cap tester/analyzer. I have a couple Sangamo 600v mica caps that show leakage around 50 volts - even though the measured capacitance is close.

Paul -

Make sure that you put a current limiting resistor in series with your PS. You do not want to blow up your meter. 73 - Mike

For what it's worth I just finished re-testing all of my vintage mica condensers. This time I put a 4-1/2" 0 to 20 microamp meter in series with the condenser under test. With this I could easily see any current down to about 0.1 microamp. The supply has adjustable current limiting that didn't quite want to go down to 20 uA, but I got it to 30 uA or less which is probably not too destructive for the meter. Yes, I could have (and no doubt should have) used a current limiting resistor per Mike's suggestion!

The first few I clipped test leads onto the condenser with the supply at 0 volts, then slowly ran it up to 320 volts. No detectable leakage. Then I got brave and started testing with the voltage left at maximum. The voltage adjustment is a 10 turn pot. It was going to take forever running it up and down. I just pressed the test leads (alligator clips) firmly against the condenser terminals. On the very first one using that method, I was seeing about 0.5 uA, and it seemed to be varying a little. But wait! I soon discovered the current I was seeing wasn't through the condenser, but through my body and the plastic insulation on the alligator clips! The variation was in response to how tightly I gripped the clips! I went back to clipping them on and removing the path through self, but continued to expedite matters by leaving the supply at 320V.

All but one of the condensers showed no hint of meter deflection whatsoever. That amazes me. One .002 mfd part did show a slight reading on the meter. It could not have been more than 0.2 uA, but definitely more than any of the others.

The lager ones, .001 and up, showed an interesting little spike when the leads first made contact, as the condenser charged.

73,
Paul

AWA friends-for your interest, I have restored many commercial radios from the late 'twenties and _never_ had to replace a mica cap that was simply aged. I have an old Heathkit capacitor checker on my bench. But I test every brand new ceramic disc I use to replace a mica cap that I may have compromised during service; brand new ceramic disc caps, even l600v rating which can be found in car radios as buffer caps, are routinely leaky; moreso, NOS are leaky by the handful. Best/73. Jim.

Thanks for the fascinating information Mike. I will try cleaning and baking the one that shows a little leakage, and report back in a day or two. That one is a little dirty compared to the rest. I would never have thought the glass would break in a home made capacitor! It's a good day... I learned something.

I've wondered about leakage testing in the case where the power supply used to test has a small ripple (not pure DC) due to bad filter caps or a inadequate design. If a small AC ripple component is introduced, say 120Hz at 1 volt on a 0.01 uF test subject, the capacitor has about 137k of reactance. That 1 volt of AC ripple will cause a current of 7.5uA.

Are my math and assumptions correct here? Does it matter that the 1v ripple is riding on 320v DC by example?

Steve, this is a fascinating question. I'm not certain I know the whole answer but here are some thoughts and observations. Disclaimer: I'm not an engineer or even a great tech. I make educated guesses and hope things don't blow up in my face! I know just enough to be truly dangerous!

I think it does matter that the ripple is riding on 320VDC. The 137k of reactance is based on pure AC, that is current which reverses direction 120 times per second. I don't think that applies in the case with some small amount of ripple on a DC supply. It is still direct current with small change in voltage at a 120 Hz rate. There are no zero crossings and no reversal of current flow to force the capacitor through charge/discharge cycles of opposite polarity. Ignoring RMS vs average issues for simplicity, let us assume we end up with DC which varies between 320V at minimum to 321V at maximum. Will this cause a measurable current through a .01 uF mica capacitor?

I just grabbed a vintage .01 uF mica and put it on my test setup. Upon initial application of voltage, the 20 uA meter went nearly full scale for an instant, then quickly settled as the capacitor reached a full charge at 320VDC. I then interrupted the voltage for approximately one second, then re-applied voltage. There was no visible indication of a charging spike, which indicates to me the capacitor did not have a fast enough self-discharge rate to drop much voltage in one second. I increased the voltage off interval and found it needs about 4 seconds of zero voltage for a barely noticeable hint of meter movement upon re-application of voltage. This is for a drastic voltage swing of 0 to 320 volts. From this I suspect if a DC voltage varying between 320V and 321V at a 120Hz rate were applied, there would be no measurable indication on this meter. I feel comfortable with that conclusion. If I can find a good way to force some ripple on this precision supply without endangering it, I will attempt to verify that.

Things become less clear to me if we had a capacitor with some leakage. I am not certain whether the charging spikes due to partial self-discharge during voltage minimum (due to leakage) would add much to the "steady state" current that would be present just due to its leakage alone. I suspect the answer depends on the amount of leakage and the value of the capacitor, but I'm guessing the affect would be relatively slight for small amounts of ripple. I'm not particularly confident in this guess. Some applied math should sort out the variables, but I think there is a good chance I would make a mess of that math!

73,
Paul N1BUG

In the limiting case, capacitors are non-linear, in that an applied DC potential will have a tendency to change the capacitance value. Just as in my example of the pressure exerted on the glass plates, that pressure is there regardless of applied voltage, but, may be miniscule. The pressure would force the capacitor plates to become closer and consequently increase the capacitance. Practically, this effect would not be visible.

I only mention this to say that an applied DC voltage does have an effect, however, once charged, the capacitor is at steady state, and, an small imposed AC voltage, or ripple will be measurable based on the capacitive reactance. So, even at 300 VDC with zero leakage detectable, a 1 volt AC ripple can be measured. As Paul points out the approximately 133K of Xc will result in 7.5 ua at 120 Hz.

How a DC meter reacts to this is a function of the damping of the DC meter as well as the frequency of the AC, but, not too well in general.

With regard to disconnecting the 300 VDC for 1 second and not seeing a spike upon re-connecting, just means the capacitor indeed has low leakage, but, it is not the same as AC, as disconnecting does not reverse polarity. Leake can also be approximated by measuring the voltage after disconnecting and timing the rate of discharge. Not counting voltmeter resistance and impurities in the air, the discharge will be due strictly to internal resistance within the capacitor. As I recall, one time constant is 1/RC and is 0.63, or, 63 % of the voltage should remain after one TC. This is of course e^(-1), or e^(-T/RC). So, if you wait an measure the time (T) it takes from 300 volts to 189 volts, you can calculate backwards and calculate R. 73 - Mike

From: Don
Topic: 2520 Message: 2520

I heard back from the museum curator. June 25 or 26 I can set up my vintage station in the museum entry cabin. I hope there will be some signals around then to be heard. That is the weekend of the antique tractor and antique engine meet there as well. I better get a portable antenna made.
I got my 40 M inverted V ant up today. Tunes up nicely and I gave it a poke with the big rig. Had a QSo with a NY Ham on CW. It works great. So I switched to the TNT rig. Not comfy with it yet. Put a variable cap in the ant circuit. Can peak it but it is not really all that different then with none & hooked direct. Tried three meters to see about power output. All read different. ??? A lot different.
More tomorrow.

Aha! Thanks Mike. I knew I would get myself into trouble with that last post. :-)

I was having trouble seeing how polarity ever became reversed with 1 volt AC riding on 320 volts DC. But you are correct, it does! I had to sketch this out on paper to see it. I see now that if the capacitor charges close to the peak voltage (321 in my example), then when the supply voltage drops slightly due to ripple there is a reverse polarity situation. The capacitor instantaneously is charged to a higher voltage than that of the supply and current will flow in a reverse direction. This is a very oversimplified description of course. Very interesting. Obviously I wasn't thinking of it that way.

I suspect the DC meter isn't going to see this very well. I probably have everything needed to put this to the test but not the knowledge to set it up in an appropriate and safe way.

Time to run. Many "must do" (mostly health related) things today but may be able to sneak off to the city for a board and copper tubing!

I’ve wondered about leakage testing in the case where the power supply used to test has a small ripple (not pure DC) due to bad filter caps or a inadequate design. If a small AC ripple component is introduced, say 120Hz at 1 volt on a 0.01 uF test subject, the capacitor has about 137k of reactance. That 1 volt of AC ripple will cause a current of 7.5uA.

Are my math and assumptions correct here? Does it matter that the 1v ripple is riding on 320v DC by example?

Steve, this is a fascinating question. I'm not certain I know the whole answer but here are some thoughts and observations. Disclaimer: I'm not an engineer or even a great tech. I make educated guesses and hope things don't blow up in my face! I know just enough to be truly dangerous!

I think it does matter that the ripple is riding on 320VDC. The 137k of reactance is based on pure AC, that is current which reverses direction 120 times per second. I don't think that applies in the case with some small amount of ripple on a DC supply. It is still direct current with small change in voltage at a 120 Hz rate. There are no zero crossings and no reversal of current flow to force the capacitor through charge/discharge cycles of opposite polarity. Ignoring RMS vs average issues for simplicity, let us assume we end up with DC which varies between 320V at minimum to 321V at maximum. Will this cause a measurable current through a .01 uF mica capacitor?

I just grabbed a vintage .01 uF mica and put it on my test setup. Upon initial application of voltage, the 20 uA meter went nearly full scale for an instant, then quickly settled as the capacitor reached a full charge at 320VDC. I then interrupted the voltage for approximately one second, then re-applied voltage. There was no visible indication of a charging spike, which indicates to me the capacitor did not have a fast enough self-discharge rate to drop much voltage in one second. I increased the voltage off interval and found it needs about 4 seconds of zero voltage for a barely noticeable hint of meter movement upon re-application of voltage. This is for a drastic voltage swing of 0 to 320 volts. From this I suspect if a DC voltage varying between 320V and 321V at a 120Hz rate were applied, there would be no measurable indication on this meter. I feel comfortable with that conclusion. If I can find a good way to force some ripple on this precision supply without endangering it, I will attempt to verify that.

Things become less clear to me if we had a capacitor with some leakage. I am not certain whether the charging spikes due to partial self-discharge during voltage minimum (due to leakage) would add much to the "steady state" current that would be present just due to its leakage alone. I suspect the answer depends on the amount of leakage and the value of the capacitor, but I'm guessing the affect would be relatively slight for small amounts of

ripple. I'm not particularly confident in this guess. Some applied math should sort out the variables, but I think there is a good chance I would make a mess of that math!

I'll trust your math. The ripple current will be, of course, AC, and won't register on the DC current meter in Paul's test set-up.

Topic: 2525 Message: 2525

Not wanting to butcher my vintage bradcast sets i looked around for a workable reo for the heater voltage. I have used the 3 wtt reos from radio shack with a hi value bybas resitor in parallel for safety and havehad succes wth that. Still i wasnt happy. To close to fialure point for my liking. I knew Cole Hersee makes a lot of the old style automotive switches for marine and industrial use. I found part # 7496-11-BX an 18 ohm HEAVY duty dimmer reostat. I oredered it. ($23). It came overnite and is good. Very robust ceramic reo with a standard radio style set screw knob stem.(although the supplied knob was uglier then ---! It is a bit smaller than the vintage radio ones but I know it has been around since the 40s anyway. NOS "New Old Style". Although the parts book didnt say so it also has on/off function. Not cheap but a practical alternative for heater voltage control when using batteries and ancient tubes. They also have still the exaxct old pull /on off switches often seen on 20s radios.
Re the cap test discussion. I got lost. All I know is caps pass AC block DC. The lower the uf or pf the higher the sweet spot frequency. I figure in the amount of time spent tesing them a tNt could have already been built. Since you have lots you can use the S or NS method. (aka smoke or no smoke)It is a very relaible test. If it smokes it simply aint no good. If it doesnt it might be actually OK. or sometimes if I want to be sure of something like that I clip them in a simple circuit to see if they work or sub them somewhere.
A crystal set for instance is a great tool with a little creativity. Signal injector, cap testor diode checker, earphone test bench etc etc.

Paul,
You can, indeed, calculate the current flow through a capacitor by considering the "DC" RC time constant transient charge portion independently from the "AC" steady-state current flow separately. You don't have to have a voltage "zero-crossing" in order for ac current to flow. Take for example the case of a capacitor used to block the DC voltage applied to a power amplifier tube plate from appearing on that tube's tank circuit. The AC current from the tube obviously flows into the tank circuit even though the voltage across that capacitor does not cross zero volts but only varies at most from zero volts to twice the applied DC voltage.

The ac voltage applied to a capacitor with dc also on the capacitor will cause the capacitor to charge when the net voltage increases above the dc level and to discharge when the net voltage decreases below the net dc level. So that will cause an ac current to flow.

The ac component of current will not register on a dc microammeter connected in series with the capacitor. As you noted, the ac current is changing at a rate that is too fast for the meter movement to follow, so it just averages the positive and negative "pushes" on its movement to indicate a zero value.

I hope this helps. I am an EE, a little out of date perhaps but still active. BEE, Ohio State 1961, MS 1962, PhD 1967.

Thanks Jim,

That does indeed help. I had my thinking all twisted up on this one, but I understand it now. I appreciate you and Mike taking the time to point out the errors in my thinking. I have learned something which will help next time something like this comes up.

Regarding failure of mica capacitors which others commented on... I have little to no experience with these small, older receiving types. I have seen a number of larger ones fail in transmitting applications.

2531. The leaky condenser, cleaned...

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-19 20:15:04 UTC
From: N1BUG
Topic: 2531 Message: 2531

I promised to report back on the one condenser that showed measurable leakage. It was around 0.2 uA in my original test (at 320VDC).

I cleaned it as best I could. Whatever crud is on that one it intends to stay! It is much better now but still not clean to the standards I would want for use in a vintage project. I tested it after cleaning. It was now around 0.4 uA!

I then baked it for a couple hours at 150 degrees. It then measured 0.5 uA leakage.

Hmm. It still looks dirty/dull and it is the only one in the lot showing any measurable leakage on my setup. Not much, admittedly, but still it's far more than any of the others. It also seems to be higher with each test. I will set this one aside as "suspect" and not use it. This one would have been most useful in a future planned project, but fortunately not needed for the imminent build!

Sorry i wasnt. My fiddle was required in town. I tell you what. WhenI find a good clear spot I will do just that. Storm here tonite so I just umhokedeverything ant wise. My younger brother lives acouple of miles away. he hasa mid 40s navy receiver. 3 to 8 mc. I wanted to see if it was reaching that far. He thught it would be a great idea "someday" I was thinking 2day :>).
here s what I did so far. I put myTNt on the meter even though I know it is nt good and it pushes 1/2 scale. I took the eter off and put it on my 1 watt QRP tx. needle just wiggles perceptibly and that is all so I know this has a lot lot more suds than the QRP solid state. And of course the solid state wouldn't even begin to light the dummy load. Near as I can tell the swr is not bad. In fact the Kenwood tuned up great on it and loaded well. I has a pao ir of 6146 in the final so it would need similar match (as opposed to a solid state rig for instance.) So i am thinking should work. I did a woalk around with a bricked key and a handheld receiver. Some dead spots but signal was a good distance away. That is how I tested the 50L6 Tx and it does the job. But I know, I hear ya.
Wait for a quiet day find a clear spot and phone. Ich verstehe!(I understand)

Paul, put a 100K resistor in series with the cap when you charge it up in case of a catastrophic failure. It'll save your meter and power supply. Ohm's law will tell you how much current you should see if the cap is shorted. You should see a gradually decreasing current as the cap charges up, and it should drop to zero if the cap is good.

Subject: Re: [AWA Group] Voltage rating?

Thanks Steve UV and Steve SL,

Now you've got me questioning how I tested these and other old condensers. Lacking a tester designed for the purpose, I put each across a 0 - 320VDC supply and brought the voltage up while looking for leakage current. What worries me is that not one of some 30+ vintage condensers showed any measurable leakage. Hard to believe. Perhaps the method is not valid? What worries me even more is some of them have an 'XX' scratched in the back. The only purpose I can think is someone used that to mark defective ones. But if so, whey keep them?

I'm going to go test them all again using an external (and more sensitive) meter to detect leakage.

BTW, the small ones seemed to have no problems with 320VDC in the short term. Whether they would survive it in the long run I don't know. Maybe I should leave one on the supply for a week. :-)

To Eddie and the group--

The April Journal will be out at the beginning of May. It has been delayed by the production of our brand new electronic publication The AWA Gateway. Available now on our website www.antique wireless.org, it's free to all. Content is generally much more basic then that of The AWA Journal; it's intended to interest and engage people in our hobby. Recommend it to interested friends. Your comments and ideas welcome.

The Gateway will be a quarterly like the Journal and will be released between Journal issues. Our timing should be back on track with the release of the July Journal.

I'll send out the information on the Spring meet, just as it appears in the April Journal, in a separate posting.

Mike,

It's not the leakage that concerns me. It is that I don't know the answer to the questions "Why is this one different from all the others?" and "Why is it slightly worse each time I measure it?" Especially the latter.

It is a .002 mfd. If I did use it, it would be for the blocking condenser in a transmitter - either from the cold end of the tank to cathode or plate to the hot end of the tank depending on whether I go original or modify the design to satisfy modern safety concerns.

Paul -

I am sure that by now you have calculated the effective leakage resistance, which is in the 0.2 ua case is equal to (3.2*10^2)/(2*10^(-6)). So, this the become 1.6*10^8, which is 160 megohms. Even when the leakage raised to 0.5 ua, the leakage resistance only decreased by 2.5, for the effective resistance then being 64 megohms, still a extremely high value.

So, for the two applications you mention, they would obviously be insignificant. Using it in the cold end of the tank coil to the cathode (ground or negative) would have no effect at all. Using it to decouple the B+ from the tank in the plate circuit always brings some concerns about safety, unless link coupled to the antenna. Otherwise, it may be possible to have some measurable DC voltage on the antenna terminal. That is why often, there is a 2.5 mH choke from the antenna terminal to ground. As long as the leakage stays at that low level, there are no issues, but, that is never guaranteed.

As to why which each attempt to decrease the leakage, it went up instead, would take a lot of analysis, mostly destructive. The impurities that soaked inside of the case over many years, are simply redistributing themselves, thereby changing the leakage. Also, how effective is your measurement tool at those low currents, and, how repeatable? 73 - Mike

Mike,

It's not the leakage that concerns me. It is that I don't know the answer to the questions "Why is this one different from all the others?" and "Why is it slightly worse each time I measure it?" Especially the latter.

It is a .002 mfd. If I did use it, it would be for the blocking condenser in a transmitter - either from the cold end of the tank to cathode or plate to the hot end of the tank depending on whether I go original or modify the design to satisfy modern safety concerns.

73,
Paul

Paul -

That small of a leakage at that high of a voltage is insignificant for 99.999% of applications. The only possible place I could see it being of consequence is in a very high impedance receiver circuit where it was used as a coupling (plate to grid) capacitor. Depending on the bias resistor used on the following tube, it may be possible that the grid may go positive from the leakage. 73 - Mike

Would you believe, yet another dumb question from me? I put off asking this as long as possible thinking I would find the answer or enough information for my feeble mind to construct an answer. No luck... {sigh} :-(

For transmitter circuits the usual suggested value for a '10 tube is 10K ohms. I have seen 50K ohms for the '45 tube. What about other tube types? Is there a way to estimate the value from tube data?

I understand ideally the final value would be determined experimentally. I'm just wondering how one comes up with a ballpark figure for various tubes. I am getting ready to order some modern resistors to stuff inside old ones or otherwise disguise in some way. I would like to order a range of values appropriate to several tube types. I'm especially interested in the lowly '01A since that is what I will be starting out with.

Sorry i wasnt. My fiddle was required in town. I tell you what. WhenI find a good clear spot I will do just that. Storm here tonite so I just umhokedeverything ant wise. My younger brother lives acouple of miles away. he hasa mid 40s navy receiver. 3 to 8 mc. I wanted to see if it was reaching that far. He thught it would be a great idea "someday" I was thinking 2day :>).
here s what I did so far. I put myTNt on the meter even though I know it is nt good and it pushes 1/2 scale. I took the eter off and put it on my 1 watt QRP tx. needle just wiggles perceptibly and that is all so I know this has a lot lot more suds than the QRP solid state. And of course the solid state wouldn't even begin to light the dummy load. Near as I can tell the swr is not bad. In fact the Kenwood tuned up great on it and loaded well. I has a pao ir of 6146 in the final so it would need similar match (as opposed to a solid state rig for instance.) So i am thinking should work. I did a woalk around with a bricked key and a handheld receiver. Some dead spots but signal was a good distance away. That is how I tested the 50L6 Tx and it does the job. But I know, I hear ya.
Wait for a quiet day find a clear spot and phone. Ich verstehe!(I understand)

125 watts!
Would be fun!
I had one of my older non fet front end recvers running today as well. Just about deffened me if I didnt standby switch it. That is a good sign.
How about this for a plan. Use the B+power from my 50l6 plate supply. 240 volts ca. Should give about 35 to 40 % more. I actually have a spare seperate PS like that built. 245 is good for 250 volts so that would give it a full push. Dont know what would happen to the current. I assume it would rise all be well. It is currently at 45ma. Anyway thanks for checking it out. I called tll 3.36 then signed off VE3LYX QRT.

It is not easy finding 1920s articles. I scratch built my 01 regen from just basic circuit design I knew of by heart. My TNT I found on a Lloyds dimpsydumster website but it has since disappeared. I was an easy build though . A couple of days and it was working. The regen took 3 weekis of fighting to get it where it is now. 01 tube isnt the worlds hottest performer so everything as to be right. I have a twinplex style 6SL7 regen and it will give any of my commercial recievers a runfor their money. The 01 set is functional and ust have been great in 1920 but beside the other one tis but a poor cousin. I was reading through the Frank Jones files on the site here and saw one tx which could be built Xtal or TNT. The low Q grid coil was subbed for the crystal. Very interesting idea. I tried with my 50l6 tx to see if I could make the beam power tube rig a tnt. I got Rf out of it but not clean enuf to put on the air. Looking at Franks schmatic I think I may have over designed it.
I tried on around 7080 tonite just now but there was no activy in 40M on CW at all so i am not surpised.
I will just keep pounding away. I know know it s putting some decent force out into the antenna.
Glad you wee able to get some of you antennas back up. Not a fun day for it. I was going to finish my new one and tie it off with some new rope but made the dicision to wait for better weather. Hope you get your TNT and regen going Paul . Lou I misread your email . I should keep my glasses on but for some reason I never have them when i need them It worked out anyway so thanks for listening. I am going to just keep pounding away morning noon and night till i make a contact. I am going to try and stay just under 7100 for a few days.. I can put my 80 meter ant back on the 80 m tx. All i need now is another Filiment battery.

Because i want to be portable for demos and stuff and because it may be a bit traditional too (I can remember when some relatives did not have Hydro as we call it. My great Uncle and Aunt ran on a original Wynncharger for instance and never had power supplied. That was only 20 miles from here) I decided to come up with an alternative source of power. I procured a old six volt car radio and today tested the PS . The virbrator hummed nicely and I watched the cap charge as it was reactivated after several years of ZZZZZZZZZ. This was a 6 volt radio but came with an adapter resistor to drop it to six volts. It is actually 8 volts when hooked to 12. I measured the HV after the cap charged it was 300 volts. A bit high . I was hoping for 250 but considereing the 8 volts vrs 6 input I figure I will be good when I adjust the input voltage to 6. It should be 225 if all is right. Will it have enuf suds to run the 245TNT? I dont know. It is intermitent demand and my code is slow (very comfy at 10wpm but scrambling a bit to keep up at 15wpm) so the demand is not constant. It gets a slight rest between. I will seperate the PS from the old radio and mount it in its own wooden box then give it a try. I will use the SONSM to test its abilty to handle the load. I suspect if the cap is good it will be quieter than my current supply. If not I will try and get rid of any hum. I was going to put in solid state diodes but asked myself "Why" It works so what would you gain?"
Don VE3LYX

BTW Still testing the tnt every few hours in and around 7090 and below.

Paul,

The grid resistor in a transmitter application is there to establish the correct value of bias for the tube. Grid bias can be established by using a power supply or battery, by using the voltage built up across a grid resistor because of the grid current flowing through it, or by a combination of the two.

For example, a type 10 tube running in Class C oscillator or amplifier service is rated (in my 1938 ARRL Handbook) to run 10 ma of grid current at -135 volts of grid bias. If all of that bias were built up across a grid resistor, the resistor would need to be R = E/I = 135/.010 = 13500 ohms. If you decided to use 45 volts of battery bias to keep the tube plate current from running away in case drive is lost and to build up the rest of the bias with a resistor, the resistor would be R = (135 - 45)/.010 = 9000 ohms.

For a 45, unfortunately I don't find enough data to calculate the correct grid resistor. My older handbooks specify grid bias for class C service as -180 volts, but none of them specify the grid current flow. So unless you can find a circuit application using a 45 that you trust, you are pretty much reduced to some cut-and-try with various grid resistors to build up enough voltage to reach the -180 volts of bias needed. At least you know where you want to go with the voltage level.

You also want to watch out about the "trustworthiness" of the source. I just finished tweaking up a 1929 style MOPA using a 10 Hartley oscillator driving a 10 amplifier. The circuit was published in QST in September, 1928, developed by Ross Hull of the ARRL and a task force he was leading to produce a transmitter that would satisfy the needs of hams when the new regulations of 1929 came into force. The transmitter design is repeated in my 1931 ARRL Handbook. In each case, the only bias for the final amplifier is established by a 45 volt battery. There is no additional resistor in series with the battery, so the amplifier grid bias is established at -45 volts. I built the rig that way to start, and the amplifier output was lousy! On 80 meters with 22 watts input I was getting only 8 watts out for an efficiency of only 36%. With 11.5 watts input I was getting ZERO watts out! On 40 with 20 watts input I was getting 4 watts out and with 10 watts input I was getting 2 watts out. Power-Output-wise, I would have been better off to run with just the Hartley by itself.

I wound up putting a grid resistor in series with the 45 volt battery to correct the operating point, and I changed the L/C ration of the amplifier plate tank to establish a loaded Q of around 12, and that resulted in efficiency around 60% on both bands. I've written up my experience for Electric Radio, and it should be published in the June 2011 issue.

So anyway, I hope this helps a little. My kids always did say that when they asked a simple question I always answered in paragraphs.

To Eddie and the group--

The April Journal will be out at the beginning of May. It has been delayed by the production of our brand new electronic publication The AWA Gateway. Available now on our website www.antique wireless.org, it's free to all. Content is generally much more basic then that of The AWA Journal; it's intended to interest and engage people in our hobby. Recommend it to interested friends. Your comments and ideas welcome.

The Gateway will be a quarterly like the Journal and will be released between Journal issues. Our timing should be back on track with the release of the July Journal.

I'll send out the information on the Spring meet, just as it appears in the April Journal, in a separate posting.

Marc Ellis

Don,

When I started this venture I had access to the ARRL Online Periodicals Archive, with all the articles from QST. I spent weeks digging through them. Great for articles, but not much help on advertisements and parts identification. I have done all right with help from this group and lots of research but still have a long way to go with my education on vintage stuff. So it is nice to get my hands on some old magazines. Going through them last night I learned more about some of the parts I already bought.

Of course it would have made more sense to buy some old books and magazines and study them for a while before starting to collect parts, but I was anxious to put this project on a fast track while I had a window of opportunity. I knew if I missed that window this might never happen. It is going great. I will soon have all the parts for the TNT in hand. The receiver isn't too far behind, just a few items missing for that.

Keep pounding away. I will listen whenever I can. 40 meters is fully operational here again. 80 isn't, still have a broken antenna. It has been windy every day. I haven't convinced myself to climb up there and work on it in these conditions. It needs to be completely rebuilt since the wire broke in two places and the center insulator got ripped apart. The next couple of weeks will be hectic. Lots of Spring work to do. Soon after into summer work. But I will find some time for building and get the TNT fired up this Spring! One thing I can always count on is bad weather days.

Hello,

I have uploaded a complete Cardwell Catalogue, 1935-6 in Files, "Cardwell Cat. 1935-6". You will see below that it was distributed by Uncle Dave's Radio Shack ending up in England. It is back home...almost.

If you read it through you will find a few interesting tidbits regarding Cardwell product line numbering changes etc. plus helpful plate spacing/voltage brake-down figures.

The pages are out of order. One slip-up and you have to delete all then start from the beginning.

73, Lou VE3AWA

Jim,

Thank you for the informative reply. I like long replies... there's more to learn. This one is definitely a "keeper" for my files. I ordered resistors in several selected values, but couldn't do all of them within what I thought to be a reasonable range. I will see how it goes. If none of them are correct, maybe they will at least point me toward a ballpark figure.

A power supply? I need to think about that. Maybe I can temporarily use one of my variable power supplies to establish what bias the tube likes, measure the current, and calculate the appropriate resistor value. I need to think that through to make sure I'm comfortable it won't harm the supply.

That MOPA sounds like a great rig!

Oh yeah! The hunt has been great! I must lead a really boring life, because I can't remember the last time I had so much fun. eBay has been the source for 90% of what I have accumulated. There is something very exhilarating about searching for a part for weeks and then one day you search and there is one! Then there are those last few seconds of the auction when all the real bidding happens. There were times in those last few seconds... waiting to see if I got an item... I wasn't sure if my heart would explode or just stop altogether. I'm a seasoned eBay'er but this hunt was like no other. I think I should have asked my doctor if I was healthy enough for hunting vintage radio parts. :-) I'm really going to miss the hunt.

It is ironic though. Many of the vintage parts I thought were super rare showed up and I now have them stashed in a safe place awaiting various projects. So today I went to the big city for the common, everyday stuff. You know, copper tubing, board, hardware, paint, etc. Good thing I already ordered all the brass hardware, because I was right about not being able to buy it around here. I got the tubing, paint, etc. The board was always the easy part of course. Boards are everywhere. Right? Well, I sorted through stacks of plain ol' boards of a dozen species. Rejects all. OK then, how about cutting boards? Round ones, triangular (?!) ones... rectangular ones with fancy designs, cutouts, moldings... but nary a single plain wood cutting board to be had. What is the world coming to? Sure, Bugs... the board is the easy part! Stair treads? Reject! Part of a table top? OK, the table was nice but at $450 I will pass for today, thanks anyway. Sometimes you just have to laugh at the absurdity of things. Tomorrow a new internet campaign begins. I'll call it... Operation: Board.

I go to Lowes . They have an isle with rough cut pine or sruce board smooth one side. I rather like them. They come in 3 or 4 foot lengths and are 12 inches wide. Almost 3/4 thick. I drill all my holes first before gluing and nailing. I used to use screws but have trouble getting the right ones since in Canada we have Roberstons (Square drive hole) which were not invented in 1929 so I resorted to glue and nails which have been around since Noah Shem Ham and Japeth got into the marine busness. Today I made a battery box for 10 12v gel batteries with the same wood. My 1920s station is all built on it to except for the face panels. Maybe it isnt what you are looking for but I offer the idea anyway in case you were not aware they have it in every store. Of course when I make my fiddles I take a tree and a chain saw and make it all from scratch. Technically poplar is the best wood for radios as it does not warp in heat from the tubes. Tis an ugly wood though. Doesnt smell nice either.

What size of breadboard are you wanting Paul?

There is an ACE hardware store in Bath. They had a WALL of bins full of ANY size of brass slot head wood & machine screws you might want. Rd., flat & oval. Need a #4 X 11/2' oval slot head unplated brass wood screw? They have 'em. Lou

Sounds like you enjoying the hunt for stuff as much as the build.

Oh yeah! The hunt has been great! I must lead a really boring life, because I can't remember the last time I had so much fun. eBay has been the source for 90% of what I have accumulated. There is something very exhilarating about searching for a part for weeks and then one day you search and there is one! Then there are those last few seconds of the auction when all the real bidding happens. There were times in those last few seconds... waiting to see if I got an item... I wasn't sure if my heart would explode or just stop altogether. I'm a seasoned eBay'er but this hunt was like no other. I think I should have asked my doctor if I was healthy enough for hunting vintage radio parts. :-) I'm really going to miss the hunt.

It is ironic though. Many of the vintage parts I thought were super rare showed up and I now have them stashed in a safe place awaiting various projects. So today I went to the big city for the common, everyday stuff. You know, copper tubing, board, hardware, paint, etc. Good thing I already ordered all the brass hardware, because I was right about not being able to buy it around here. I got the tubing, paint, etc. The board was always the easy part of course. Boards are everywhere. Right? Well, I sorted through stacks of plain ol' boards of a dozen species. Rejects all. OK then, how about cutting boards? Round ones, triangular (?!) ones... rectangular ones with fancy designs, cutouts, moldings... but nary a single plain wood cutting board to be had. About original TNT size for this first build... 10x14 inches give or take a bit. Hopefully 3/4 inch thick or I will be ordering new hardware to compensate. I will likely not find something exactly that size online. That's OK, I will adapt accordingly. The part about board hunting was intended to be humorous. It's true I couldn't find anything, but I'm not worried. Not yet, anyway! BUGs will not be intimidated by boards!

There is an ACE hardware store in Bath. They had a WALL of bins full of ANY size of brass slot head wood & machine screws you might want.
Ah yes, the "other" Maine -- where all the people live. Rumors I've heard about stores there must be true! :-)

I go to Lowes

I went to two Lowes stores and a Home Depot. I admit I'm being a bit fussy, but I thought the selection was rather poor. When I looked on their web site Lowes' maple boards were about right. In the store I found the wide ones are constructed of narrow boards glued together. Glued together with gaps, or so that the surface is not flat, or they were warped, twisted, curled. Same story for oak. Poplar were better but all had deep pits - up to 1/4 inch - apparently the tree(s) had voids or rotted areas in the wood. Pine was mostly curled, warped, split, or looked like somebody pummeled it with rocks for an hour. I've often wondered if the boards they stock in stores up here are ones other stores couldn't sell. Just kidding... I think. Anyway this is getting way too far off topic. I'm off to perform my daily stress test on eBay's search engine! Wish I could get them to pay me for this testing service. :-) I have the routine down now. What used to take hours I can now run through in 30 minutes while half asleep and with one hand tied behind my back.

2574. Very interesting tube test. 45, UX45, 71A

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-22 14:42:22 UTC
From: Don
Topic: 2574 Message: 2574

I was playing with my regen today trying different tubes and voltages. I found 56 volts with an 01 to be far superior to anything else. I tried my 71A too at as much as 120 volts. Most volume was from 01 at 56 volts B+ At 90 it loses something. Not quite as good.
SO
I decided to move to the TX. I hooked up the power meter and even though I know it has been damaged it still works and tests were absolutely repeatable ie; same results ever time, so the lack of caibration in not significant just inconvenient for this test.
First the UX 245. With heater optimized just over 2 watts. I tried a 45. It was a dud! Heater works but no oputput but wait I have several. Next one beat the pants of the UX245 with 2 1/2 watts almost exact. Then in a moment of weakness I popped in the 71A. After all B plus is 150v which is ok for a 71A . Bingo. Well past 2 1/2 but not quite 2 3/4 watts. I repeated the tests three times to be sure and got the same results each time.
My conclusions.
UX245 is the weakest not surprising it is a very old tube design even though it was NOS in the box.
45 obviously an improvement over the original
71A in ths tx with its current power supply it is running near max recommended B+ but still in spec which is probably why it outperforms. When I get 250 B+ it will be too much for it so I cant use it then and I suspect the 45 will pass its 2 1/2 plus when the 45 gets near 250 + however at the moment the 71A is in the set.
I did not expect these results BTW. Just curious though and tried them.

This little vibrator PS was liberated from a Motorola car radio with a delicate surgery (Ryobi Recip Saw. Indelicate would have been a Mastercraft saw.) Surprisingly it still works after its recent surgery. Maybe tomorrow I will build it a home. 250+ volts and 6 volts heater supply. Time will tell if it will be an improvement for the Tx or a wash. Investment so far $00.00.

Base made and stands for small PS installed. Room for the gel battery too seen in the foreground. Although not charged here battery had 12.45 volts and powered up the PS nicely. A glowing tube is a beautiful thing! Should have it all wired and operational tomorrow.

Thanks Jim.

It was very interesting reading about Hoffmeyer's and looking at the pictures of their mill. Quite a history there and it looks like a real quality operation.

Now I'm torn. I wanted to build something pretty. I also wanted to build something authentic. I doubt many builders cared about pretty in 1929. It was get on the air any way possible!

I may have overlooked a local source of clean pine boards. The trouble with pine is it's so soft; hard to keep things securely anchored to it without large washers under screw heads. I have some scraps of that pine left over from a renovation project. I will go experiment with it.

Paul

You can put 400V on a '45 in a TNT, perhaps even 500V (I'll have to check the old literature) in ICW service (don't brick the key).

> I will seperate the PS from the old radio and mount it in its own

I think you are discussing a vibrator supply - if so there will be a HV wax-paper cap across the HV secondary of the power XFMR. When this fails it will take out the vibrator, and it is a very common failure. Replace it with a modern mylar of the same capacitance value and equal or hight voltage rating. There is no sense at all replacing a tube rectifier with solid-state diodes here; I agree.

> BTW Still testing the tnt every few hours in and around 7090 and below.
>

Are you sure your TNT is on the frequency you think you are on? If your monitor receiver is a superhet you could be on an image frequency or other spurious response; easy to do (been there, done that). A frequency monitor based on a calibrated shielded regen receiver (such as the BC-221 or LM-5) will only respond to the frequency you want and harmonics thereof. And the harmonics are far enough away that it shouldn't be ambiguous.

73,
-Larry/NE1S

Thanks Larry for the tips. Yes it is an old vib supply.
I will check out that cap and sub. It is possible that I am not where i think I am. Here is what I did to be sure as I could. I took my regen and put it where I thight 7.3 mcs would

be since I have a 7.3 mc crystal. I have a 7400 chip crystal oscinator I use for spotting my other regen and tx which are rock controlled so using the 7.3 chip I spotted the 40M regen. I then tuned down slightly to theCW portion of the band. I then brought the TNT on Freq. Not fopol proof either . What is really sick is I have in the basement a HP pixie tube freq testor. My dad gave it to me telling me it still works and will probably never fail. I have never even plugged it in but I am very suspicious that what you say may be true. otherwise i dont know why I cant get out. the field strength meter is bouncing in the shack when I key with no antenna in it so something is happening. The dummy load lights well enuf and i have seen as much as 3 watts on the meter at higher freq (7.2)

An observation from a newcomer...

I've been following the discussion (Don/Larry) on tube tests and voltages.

From my perspective, one of the biggest mysteries for a power hungry newcomer on a budget is figuring out which tube would represent the best investment, power vs. cost.

The old literature (that I had or have access to) seems to do a good job of documenting what can be done with a '10 tube without making the signal too ratty. I've seen no real data or suggestions for anything else from the lowly '01A to the '71A to the '45. Safe plate voltage isn't much of a mystery but how much current one can run with each of these tubes while still getting an acceptable signal seems to be completely undocumented. Is it impossible to establish some general rules of thumb for these other tubes? Or were they just too uncommon in transmitter service for anyone to bother? Or is the information out there and I just haven't found it?

Just curious... as usual!

Yep. Especially since a lot of the old 1929-legal triodes we use i our transmitters have become VERY expensive due to competition from tube audiophiles, and audiophools.

The '45 was pretty common in XMTR service in 1929 because they could be "borrowed" from the family radio's output stage. Same deal on the '71A, but less so.he '71A isn't cf as much power/plate voltage as the '45. THe progression from low power to high power is '01A -> '12A -> '71A -> '45 -> '50 -> '10 -> 203/211. The '50 wasn't used much because it supposedly made a poor RF power tube. The '10 was the most popular in low-powered transmitters, followed by the '45, according to the frequency I encounter them in descriptions of the transmitters of the time. According to one article I read, the '45 puts out more RF at lower voltages than the '10 at the same voltage. Probably the plate resistance is a good indication of this.

Attachments: 1 described; binary payloads are missing from this source WARC

Its done and it works!
I havent charged this battery yet but power is up . It wont handle the 45 well but with the 71A it works great. Power is up considerably on the meter. Plate voltage is about 220v average. If I punish it , long key down , it did drop to 150V . i will see what it is after i charge the battery. I figured if a 245 or 45 can stand 400 then a 71A should be able to suck up 225 for intermittent duty. Signal is much cleaner on the monitor RX too. No Hum .

Topic: 2588 Message: 2588

I know a lot of you use the Heathkit PS-3 and PS-4 for HV supplies on the homebrew transmitters.

I recently acquired a PS-3 and replaced a couple weak tubes and filter caps and recalibrated the meter.

I was trying it out today on my '45 Hartley. On key-down the supply (set at 350v) sagged almost 100v with only 25 mA plate current. Of course, this causes a very chirpy note.

Has anyone delved into the workings of the PS-3 enough to know where I should be looking for the regulation problem? I do have the manual but it is not describe this issue in troubleshooting. The 1619's and the 6SJ7 all test good.

Thanks,

Steve KK7UV

Tis my belief based somewhat on experience that a good cap bank can help some stabilise voltage but it must be overdone somewhat. Eventually when the caps are drained the PS will be stuggling to supply but in a CW code situation that should nt be a problem except maybe for tune up which can also be done with a bit of practice sending VVV VVV VVV . Also limiting the discharge rate can aid a bit although it may hurt power output slightly .The best solution is a huge overbuilt PS that doesnt even feel the Vintage 1 tubers demand. Big transformer , choke input with a larga cap bank. I will do almost anything to avoid regulation but maybe that is not a good idea either.

I just use the non-regulated P/S from an old 1920s Kolster BC receiver
with a (horrors!) voltage divider to bring down the plate voltage to where
I want to run it. I do use more capacitance in the filter than original.

The regulation is undoubtedly poor, but the note quite acceptable with the
PP TNT and Hartley.

I have two vintage 20s PSs here and had given great thought to using them Hate to chuck them out.
On my Bare-essentials TX (50L6) I use my favourite PS, a transformerless voltage doubler Although Lou did give me a some hum RST. I think I am going to take a break from the TNT project for awhile and run that TX on 8oM for a few days.

:-(I had originally planned to skip all the smaller cousins and
use a '10, but have delayed that indefinitely due to cost factors.

> THe
> progression from low power to high power is '01A -> '12A -> '71A -> '45 ->
> '50 -> '10 ->

I understand the progression but still have no idea how much power
to expect from each type when running at optimum voltage. Except for
the '10, which is fairly well documented. It's hard to decide
whether to spend 4x the money on a tube further up the food chain if
you have no idea how much more power that tube might produce.

If I ever get rich, I will buy a few of each type, thoroughly test
them in a transmitter or three, and publish the results. Next
lifetime. :-)

2605. Re: [AWA Group] New guy

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-26 16:16:20 UTC
From: Don Buska - The Radio Lab Works
Topic: 2600 Message: 2605

Welcome to the group Evan. I don't believe either AWA Yahoo Group is what could be considered "official". Although both groups have their share of AWA governing body as members. The "Antiquewirelessassociation" group was started via the governing body of the Carolina Chapter (CC-AWA) of the AWA and this one by some of the general AWA membership. The AWA Group (This one) leans more toward the communication historical side of radio, especially the ham radio arena. The other group is more inline with the BC radio stuff. That's been my observation and experience. Naturally both will transverse that line from time-to-time.

Personally I leaned more toward the historical ham radio side of things and I was not a member of the CC-AWA so much of the traffic on that groups email reflector didn't hold much interest to me. However, your interests may be more diverse and you'll find one or both groups of interest. If you review both groups web-based email archives (via Yahoo) you can decide which will better serve your needs in the long run.

Again Evan welcome to the group, I hope you find us informative, fun and to your liking.

2606. Vintage Computer Festival East 7.0, May 14-15

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-04-26 20:18:57 UTC
From: evan
Topic: 2606 Message: 2606

Hello again, new group-mates,

I asked Mike F. if I could post this, and he said go for it ....

My primary hobby is vintage computer collecting. Just like you guys, there are thousands of vintage computer collectors around the world. Our hobby is defined (more or less) as being systems from 1965-1985 -- before computers were room-sized beasts, and after which they're just modern PCs -- always some exceptions but that's our general approach. Of course we also collect software, manuals, storage, books, magazines, etc., and we all strive to make our systems operational.

Anyway, I run a non-profit user group called MARCH - Mid-Atlantic Retro Computing Hobbyists - which has membership spread out from Hartford to Pittsburgh to D.C., and operates a bricks-and-mortar computer museum co-located at the InfoAge Science Center in Wall, New Jersey.

Our flagship event is the Vintage Computer Festival East. The upcoming edition is VCF East 7.0, May 14-15, at our museum. Mornings are historical lectures; afternoons are the exhibit hall. Our exhibit hall is unique because the exhibitors are required to have everything up and running! We also have hands-on workshops, book sale, consignment, food, prizes, etc. ..... tickets are just $10/day, $15/weekend, and free for kids. The revenue provides our computer club's budget for the next 12 months.

Web sites for the event are http://www.vintage.org/2011/east and http://www.facebook.com/vcfeast7 .... I know there is (some) overlap in our hobbies, so hopefully some of you can check out this event.

Best way to reach me with any questions is evan@... or (646) 546-9999 and I'll keep checking in here too.

Thanks,
- Evan Koblentz

Thanks Don. Just to clarify, our event isn't a swap meet, although it's certainly possible to find the power supply in our consignment booth. For direct help, join our own Yahoo group (http://groups.yahoo.com/groups/midatlanticretro).

I've never been to Germany, but that is indeed where my surname originated. Heard as a child that one day a group of people arrived at Ellis Island from that city, and they were all assigned it as their new name. Don't know if that is true but it sounds plausible. :)

Repying to Paul's question about how much power to expect from a tube when it is operating in 1929 power oscillator service under optimum conditions:

The maximum RF power output should scale reasonably well with the tube's maximum plate dissapation - i.e., make the assumption the plate efficiency won't change (much) between tube types. I think this would be a reasonable assumption.

I have a lot of trouble understanding what to look for ina tubes specs that would tell me what it will be like. Amp factor doesnt seem to be too relative . I am trying to figure out why a UX201 regen is so lazy compared to a 1930s tubed regen I compared today afterwe talked about this before a batch of UX201and some 01s UX201a is definately a superior tube to them but what would be equivalent say to 1/2 a 6SL7 or even 1/2 a 12ay7 in an ancient triode. With the 01s and the UX201A you are saying "come on tube! Look alive. With the 6SL7 you are saying "whoa baby!". The reason i am so interested in this is I want to build a period correct regen with a late 20s early 30s tube but I want perfomance like my 6SL7 gives. I know I will need two triodes to make an equivalent circiut. That is not a problem. I want a tube that performs. Something with some snap as it were. I have tried a UX201A , some 01s a UX245, some 45s and the 71A in the regen. I was left unimpressed. Were the early tubes that poor compared to say tube designs of the mid 1930s.? I have some 56 tubes but I ate to build if they are not up to snuff . I need an early triode but a real good perfomer without going to high voltage and a TX power tube. The 6SL7 regen runs on 130 to 145 volts depending on what iIfeel like hooking up. The UX201A runs best on 56 volts. although I have had it over 100. I should say perfomance does not suffer down to 56 volts. .The set works but it is so far removed from the other regen in performance I think it must be related to the early style tubes I used. I have played with everything else like grid leaks both R and C . ticklers both # turns and spacing All types of regen control. Ant coupling methods etc. While I have a functioning radio I am not thrilled with it. I need to understand what part tube choice plays and how can you know when you choose it will perfom well. Any suggestions?

Sometimes you say something and then it becomes obvious. I just realized I was testing the 71A at 56 volts. 150 would be more appropriate and maybe the hogher the plate volts the hotter the performance in general terms. my 6SL7 regen runs on over 100 volts. I am thining out loud here but maybe the biggest improvement in tubes was thier abilty to handle a greater plate voltage?
I am trying to understand better since I am now of the beaten path and making y own stuff without a schematic.
Any advice would be interesting (on tubes , not on being of the beaten path.)

Don,

In a regenerative detector, typical plate voltages to achieve a "sweet spot" are quite low - 22.5 - 45V. To acheive regeneration you just need enough gain to overcome circuit losses, and that's not much. For audio amplification (which the detector tube also does) plate voltage is a factor, but not a strong one. A higher mu tube probably gives more audio gain, and early triodes were low-mu. I think the performance is a stronger function of parts quality (especially the tuned circuit and headphones, if the detector is driving the 'fones directly), circuit design, layout, and lead dress.

But I've played with a couple of 0V2 regens using UX201As, and they've got all the gain you need.

Were they single triode sets or 2 tube versions? This one is a single tube and while it works it leaves something to be desired. Probably because i am spoiled by my other set. Sort of like comparing a brass band to a picolo player.
Thanks by the way for the explanation. I have the set right now on a 3 1/2 foot piece of wire and it can pick up shortwave broadcasters well. But ham band is a bit quiet. I had it on my 20 meter vertical before and had it working decent. But when I turn on the other set the 6sl7 twin plex which is just ona 12 inch loop ant in he wondow. I wonder how can these two sets be so different. Is the lalk of the audio stage really that big a deal? Anyway I would like to know more about the circuits you built. with the UX201A

Today I did a lot of experimenting. I added more puffs tot he 01 regen gridleak and got a better working radio. No pop up top just smooth. Can also now run more antenna coupling. Then I turned to its companion TX with the 71A sitting in it. I whipped up a voltage doubler PS (transformerless. My favourite supply) I had started one earlier for something else but finshed the Ps part and brought it up and hooked it on. Huge power improvement.Plate voltage drops to just over 280 from just above 300 on keying. I think I can cut the swing in half with a load resistor or Bleeder that pulls it down a bit when not keyed but doesnt hurt the voltage under load. . That would be quite liveable. I like these PS because the cost so little. The power cmpany supplies the trasnformer so I dont worry about if it can handle the load. I use a keyed ac plug and will wire it to an onboard ground fault recepticle for safetys sake. I am going to add a 6 volt dc filment supply to the PS so I can run only with it. I can pull off 140V on one leg of the doubler if need be to or build an aditional rectified 120 volt supply in the same board. Now to find a small size 6 volt transformer. I think I will also build a audio amp speaker deal on it which is what I started out making with this PS. The speaker,audio transformer, octal tube socket and on off switch/volume pot are already there.

Hi Don! I think you're responding to my post, so here goes...

> Were they single triode sets or 2 tube versions?

I had said they were both "0V2", meaning no RF stage ("0"), vacuum-tube regenerative detector ("V"), and 2 stages of audio amplification ("2')! Don't look at me, this was the nomenclature system used by the ancients!

> This one is a single tube

Without the audio stage you're asking a lot from the regenerative detector. Sure there can be a lot of gain there, but for weaker signals, you need a whole lot, especially if you're not using a good antenna. You're doing well with a homebuilt regenerative if it works well on a short wire or loop; congrats!

> Anyway I would like to know more about the circuits you built. with the
> UX201A.

One is one Bruce W1UJR found in an antique store, and we later identified it in the 1926 ARRL hanbook. Pictures and story are here:

http://ne1s.rfburn.org/1926_ARRL_regen.html

The other one is a clone of the Pilot Wasp I built for Bruce:

http://www.w1ujr.net/gift_from_ne1s.htm

The circuits for the above two sets are nearly identical.

And then I installed a matching heater cntrol in the TNT on the opposite side of the one on the regen and again on the opposite side of the regens ant rtrimmer access hole I put a hole so I can see my RF indicator bulb glow in the dark. And also for tune up. I like things to match in a balanced sort of way (warum? Ich weisse nicht)
After the rewire and installation of the RF indicator loop and bulb I hooked everything up, I tested it first on the dummy load. Dummy is getting a bit too bright perhaps. I loaded it up on the 40 M antenna at 7037 and pounded a little brass. Sounds better on my monitoring stuff. So i am going to leave it set up and will try it now and then. FIddle night tonight and playing tomorrow morning as well so I dont know when I will get a chance but will be on 80M tonight wth my rockbound rig as promosed above.
Here are pics of the "Twins" with all their updates. 71A like the extra voltage!

To my Hungarian ears, they both sound the same. The first time we encountered that (my ex-wife Kathy and I) was at an AWA meet at Canandaigua in the late 70's. Just could not get used to it initially, and then of course we tried to mimic it. There were a lot of Canuks there, being it was not that far. I imagine, Rochester may even be easier, eh. 73 - Mike

Well, it's not surprising you've never heard it. I had learned it only
because I hang around these old radio mail lists WAY too much ;-)

> Spent most of the day here working on my rigs. Is too windy to enjoy the

> I like your radios BTW. Very nice work.

Thanks. The first one wasn't built by me; it had been built "back in the
day." All I did was clean it up and restore it to operation. The second
one (the one I built for Bruce) had been planned for some time, and I had
all the parts from years of hamfests and antique radio meets. I finally
found the time to build it back in late fall 2008.

> Thanks again.

My pleasure, Don!

Coil forms. Today while at WalmartI discovered some readily available heavy duty coil forms. They had to change the roll in the phto printer and therewas about a 3 inch hard cardboard form. A slot in the top would allow for a variometer set up . I will varnich it sevral times. they wanted me totake more. I just brought one.She said they had boxes of them so that means any of us living near a Walmart storecould have some for nothing. Here is a pic.

This I really like. An old triplett meter. Bakelite case , no damage. o to 5000V ac or DC. 0 to 1 amp current. Full Resistance scale. I went to put in a newbattery as it looked unused for many yeaars. Switched to OHMS. crosssed the original old leads and "oila" the meter almost zeroed. Minor adjustment on the thumb wheel and it did. In with this I got a 1/2 earphone set (2500 ohm.made in Bufffalo) and a package of Deutsche geld from the 1920s. Cost $20.
I also bought a 12 Volt modern vibrator for a new 12 to 120 volt supply I am building. Turns out the guy who fixes old car radios in his retirement was a Collins Radio Canada engineering dept employee who actually knew my Dad when they both worked there in the 50s and 60s.
And then in a moment of weakness I bought a Atwater Kent 1920s radio complete , even had an extra tube. (X201A) inside. It is missing the name plate on the front but is actually in good shape. It isnt here yet as I went to the Fleamarket in a 41 Willy Hemi powered coupe with my pal. There was barely room for us and our jackets. A friend is bringing the radio here tonite. There was also a 1955 ARRL handbook. I left it because I have a 48 and a 56 already. I want one from the 30s or earlier.

Another one (dumb question)

What is the thinking on using a bayonet tube socket with metal shell in a transmitter? I'm thinking the shell might add significantly more grid to plate capacitance, perhaps not a good thing.

Not a dumb question at all; it shows you're thinking.

I think that this capacitance is such a small reactance at the HF frequencies that you can ignore it.

It MAY be noticable at 20M and higher HF frequencies (just maybe), but if you will be running a 1929 rig up there you're even crazier than me!

FWIW, I am using such a bayonet socket with metal shell in my Hartley, which I use exclusively on 40M.

73,

Thanks Larry.

That's what I thought, but there's this talk of Air Gap sockets with long leakage path and low capacitance... so I thought I would ask.

I have some Air Gap sockets but they are in poor to very poor condition. I'm trying to decide whether to use one of those in the TNT, or a Federal bayonet style socket which is in very good condition.

I plan to be on 160/80/40 meters but nothing above that. Actually the TNT may never get on anything but 80. I was not able to exercise self control or good judgment during the parts hunt, so I have all this stuff..... I'll be building more rigs than planned.

Radio arrived in my truck overnite. Checked the spare tube in my "tube tester." (Regen set) It is good. Radio seems good . I need a front oval plate (Atwater Kent cast logo.) and a few screws but everything else apppears to be there. Battery wires have a bit of fraying but nothing a few minutes with a razor bald wont fix. Might fire it up tomorrow.
Today went to Picton Antiques in the Crystal Palace show. Found a Key base with shorting bar there . They did not know what it was . Missing the key but the base is the same as the one I use on the TNT except it os plated so I should be able to find a key. If necessary could make one but it would take a while!
Here is a pic and the lettering I found on the key. Some folks know a lot about old keys. Unfortunately I dont---yet. If you do I am all ears. (Never mind the elephant pic Lou ;>)

Lou -

I didn't even read the text, just immediately recognized the layout! :-) I built and used one in 1958 and for about the next two years. A Heathkit VF-1 (couldn't afford the WRL 755, it cost almost as much as the transmitter!) and an HQ-129X handled a LOT of CW traffic. A BIG improvement over my BC-454 (ARC5) 80M receiver and single 6L6 'power oscillator'. One DX contact from Louisville, KY was Grand Island, NE..... Seems my 80M 6L6 also worked on 40M! :-)

Hi John,
Your the winner. I would have thought they would go instantly. What I'll do is package them up and run them down to the PO. I'll let you know the cost when I send them. I got them Priority, in a Flate Rate Box from CA for $9.80. I'll keep you posted (no pun intended).

Gentlemen,
I have a small collection of old radio magazines that I will gladly give to anyone willing to pay the freight to their QTH. I have attached a MS Word document listing of the individual issues. Please don't pick and choose. You want one, you get them all. As you might expect they are all a bit dog-eared but are in fair condition.

Paul.

I'm using two of those sockets in my MOPA along with a pair of 10Y tubes. It is running well on 80 and 40. There should be an article about it out in the June issue of Electric Radio.

Jim, W8KGI

2669. Re: Metal bayonet socket in xmtr?

Thanks Jim,

I will try to find that issue or buy one when it becomes available as a back issue. Since those sockets seem to be fine for transmitter use, I think I may go ahead and use the Federal I have here. It looks nice aside from being a little "beefy".

From: Don
Topic: 2670 Message: 2670

I was working on my Atwater Kent today. Model 20. I have the hardware all found and replaced and only lack the oval logo on the front and then I'll have it all. Filments all light. Detector grid bias is good. So when I get all the batteries hooked up I suspect it will work. Ran across a final amp tube in it. Not sure it should be in the final. A tube I had not heard of before. DX235 Northern Electric. Made in Canada. 1926
I can not find a spec sheet on it. help!
Don VE3LYX

Don, my AK20 doesn't have a 235 in it. All the tubes except the detector are 201A's. The detector is a 200A. I'll try attaching a schematic, but if it doesn't work, go to:

.www.atwaterkent.info/TechData/akDrawingIndex.html

The DX235 looks like it might be a triode but the voltages and pin out are unknown.

Leonard

Thanks Leonard,
I went there and got all three Model 20(A thru C) schematics.
All I could find on the DX235 was it was a tube similar to the UX201A but was designed by Westinghouse for Northern Electric Canada. It has a different kind of filment near as near I can tell. It get warm the same as the rest but doesnt glow. At the moment I have the spare UX201A back in.
Thanks for the link.

An old friend Bob Bosma told me when he brought my Atwater Kent from the Stirling flea market that he had an old morse key he bought at an neighbours auction sale. Said he didnt need it. He just didnt think it should be sent to the dump. Bob is a carpenter. (A very good one I might add) so today in the rain he got a day off. He brought the key. He gave it to me. He wouldnt even let me pay him what he payed. Just said he has "one in the bank" with me.I insisted on atleast buying lunch. Vibroplex No 34032. I am still pinching myself. I never thought I would ever have one. It wasnt even on my bucket list.

Ok I will try. Part of the problem is my close eyesight is not good and I am severely colour blind so I dont really know if it is a good pic or not. I will endevour to do better though.
Here it is after an hours clean up and a couple of minor repairs. I would have to use it left handed but that suits me. I will try it out later on my 40M TNT.

Oh, OK. 94032 is the number. I saw on for sale on the site Jim mentioned that was 1620 numbers ahead of this one and it said 1923. I find it hard to imagine this one is that old. I washed it in diswashing soap and dried it immediatley. Then treated it to a light spray of PAM and wiped it down. It came right up and looks good. I like using it beause I can send easily with my left hand. My heathkit keyer is reversed to this one as is my homemade 555 chip keyer which is a piece of crap anyway as the dit dah spacing of that design left a lot to be desired. I built it from a QST or CQ article. Being a mechanic by calling it is nice to have a hunk of brass and iron singing away. Gives this ol boy comfort.
I have3 1/2 keys plus my two electronic keyers. One is a Signal Electric Company from Menominee, Mich and has a buzzer on it as well which can be hooked up for code practice. I am missing the buzzer cover but it is the one I use all the time on my 50L6 TX. The same fellow who gave e this bug gave me that one as he found it at the dump in the dirt.
The other complete one is a real nice strraight key, plated with a skirted knob , Cast base and steel lever. A very nice key but no name on it anywhere. I have had it since I got my ticket (1980) and still love it, It is on my 40M TNT. The other is the base of a leg key I bought Sunday. I will find a lever for it , no rush. I am off to Deutschland a week from tomorrow and will look for a key from the land of my ancestors. Going to the huge Technik Museum in Sinsheim and am hoping there is some radio stuff there to see as well.
Next I will cast one myself from aluminum. I learned to cast last year. (I always try to learn to do something new each year)

I have3 1/2 keys plus my two electronic keyers. One is a Signal Electric Company from Menominee, Mich and has a buzzer on it as well which can be hooked up for code practice. I am missing the buzzer cover but it is the one I use all the time on my 50L6 TX. The same fellow who gave e this bug gave me that one as he found it at the dump in the dirt.
The other complete one is a real nice strraight key, plated with a skirted knob , Cast base and steel lever. A very nice key but no name on it anywhere. I have had it since I got my ticket (1980) and still love it, It is on my 40M TNT. The other is the base of a leg key I bought Sunday. I will find a lever for it , no rush. I am off to Deutschland a week from tomorrow and will look for a key from the land of my ancestors. Going to the huge Technik Museum in Sinsheim and am hoping there is some radio stuff there to see as well.
Next I will cast one myself from aluminum. I learned to cast last year. (I always try to learn to do something new each year)

Thanks Dan, Just washed it and pammed it. The right handl pagggel has been changed and is hand made. I guess they used to have a knob there . The hand made one is pretty good and appears to be to emulate the "racer" set up. No matter as I have simlar on my electronic keyers so it is welcome here.
As mentioned before I have been givien permssion to operate a vntage station June 25 and June 26 from the Ameliasburgh Museum. Word is I am in the special building with the 500 HP Goldie Corliss steam engine. Since I now know this key is period correct iwill use it. I hope some of this group will find time to operate during those days so my den mo will be actve. And i dont care if they are using modern or antique rigs although antique would be awsome. I just want to represent Ham Radio and its history well. I will be on the 80 meter 1930s set up and the 20s set up will be on static display. I will applfy the phones output so the public can here the dits and dahs.

Hi Don,

Your application of "PAM" spray is a stroke of brilliance, IMHO!

How long-lasting are its effects...? Does its presence make the end-product feel "slick" to the touch, and/or leave any traces of oily residue on nearby paperwork, fingers, desktops, etc. ...?

I'm thinking here that "PAM" might make a nice restorative & E-Z finish for classic black crackel paint jobs...

Hi Larry,

Many thanks for that info...

Just what is that stuff, anyway...? Is it literally for airplane cockpits...?! I've never heard of it before...

Probably not available here in Canada anyway, but just where does one get the stuff, anyway...? I'll be at the AWA Spring Meet this weekend---maybe I can locate some in Victor, N.Y. ...?

Thanks in advance,

Eddy -

I would question the advisability of spraying vegetable oil (fat) on
electronics. It can go rancid over time, not good.

I know that petroleum products are on the 'evil' list these days, but
I'd prefer petroleum over food being sprayed on my equipment. :-)

I just rubbed it with my finger and rubbed the fake slate desk. No trace Long term I dont know. I wanted a coating that would protect against corrosion especially after having washed it in hot soapy water. I dislike WD40 so I tried it instead. It worked for me. It was just a spur of the moment idea. I acept no credit for it as it was an accidental discoverey.

From: N1BUG
Topic: 2700 Message: 2700

I have started construction on the TNT but I am still struggling with lack of practical "how to" knowledge in some areas.

I have several Jewell 53 and 54 meters (metal case) that need paint. Does anyone know a safe way to remove the glass? Does anyone have suggestions on how to go about painting these with the glass in place without making a big mess of it?

Just thought I would ask before I set out on my own. I managed to come up with a recipe for cleaning variable condensers that fits what I have to work with. The only casualty there was a few pieces of damaged hardware before I learned what part of the process NOT to be aggressive with. :-)

Hi Paul,

I painted a Jewell without removing the glass by using a wide roll of blue masking tape that is commonly sold with paint supplies. Just apply the tape with no wrinkles, work it down well into the creases along the glass/bezel, then carefully trim with a razor blade. I will be doing a couple more of them this summer.

Steve KK7UV

Paul,

Sorry, got carried way with the yard work...

Separate the metre from the housing. Strip the old paint, lightly sand then clean with methyl hydrate. Clean both sides of the glass with Bon Ami.

Furthering Steve's helpful hints. You can not work it down well into the creases too much. Suggest though using a Xacto knife with a new blade. Easer to hold.

Make a painting jig. Mine below.

Cover twice with metal primer. XXXX steel wool between all coats.

The original paint was a semi-gloss. Give the housing three light coats of best quality paint allowing 24 hours between each coat. Patience...

After you remove the tape you may see that a bit of the adheave was left behind in the crease. A finger nail works great here...

The result is well worth the effort, Paul. 73, Lou

I forgot to mention a slightly important step. You need of course to protect the inside of the shell/glass from overspray.

Mask the inside of the shell wall leaving the shell's edge exposed for painting. When done, press in a wad of paper towel to protect the glass.

Think that's it.... Lou

Photos please...

Thanks Steve and Lou !

I almost have it, but 3 questions:

Can you recommend a type of paint stripper? I found several types, for different types of paint.

Is methyl hydrate the same as methyl alcohol? Tried asking Google, got conflicting answers.

How do you sand near the glass without scratching the glass?

Paul

Thanks again Steve!

Citristrip looks very interesting. None of the "local" stores (40 miles away) had anything that said it worked on multiple types of paint... and all were far more expensive than Citristrip is online.

Of course there is good 'ol PolyStripa. Available everywhere.

For best results tho, sand blasting removes the paint and micro-pits the brass for better paint adhesion. Thanks to a neighbour here that's what I did.

Tks Mike 4FS....

The only question I have about Don's post is his assertion that WD-40 is "silicone based." While it may or may not contain silicone compounds (I'm too lazy to research it at the moment), it's my understanding it is mostly "Stoddards Solvent" (=kerosene, which is a hydrocarbon). And yes, it was developed and intended to be used as a water displacement agent (hence the "WD").

Hi Eddy,

Bruce has a supplier; maybe he'll chime in, and if not, you can contact
him directly. As far as it's intended use, I believe Lou has already
answered that, and you've probably read his reply by now.

Just for the record I should say I have always used veg oils on my guns. (yes we can own guns in Canada. but they are for targets or hunting. There would be no valid excuse whatever to use them on people here.)
I have been doing that for about 40 years and they are in great shape and no, they dont stink. All Winchesters except on ol muzzle loader(45 cal)So as you might imagine I have no worrys about rancid oil etc.

Chemistry 101
Oil is lighter than water and kerosene is oil or petroleum. Silicon is heavier. To displace water it must be heavier. IE Mickey Rooney cannot displace Hulk Hogan.

I'm not sure about the validiity of that argument, Don; meaning I really don't understand the process well enough to determine if it is or isn't. (My BS in Chemistry was obtained over 30 years ago, and ended up doing EE in the semiconductor industry for a living, so have forgotten a lot!) I do doubt, though, that it's that simple.

In any case, Wikipedia sez:

"WD-40's formula is a trade secret. The product is not patented to avoid completely disclosing its ingredients.[2] WD-40's main ingredients, according to U.S. Material Safety Data Sheet information, are:

50%: Stoddard solvent (i.e., mineral spirits ? primarily hexane, somewhat similar to kerosene)
25%: Liquefied petroleum gas (presumably as a propellant; carbon dioxide is now used instead to reduce WD-40's considerable flammability)
15+%: Mineral oil (light lubricating oil)
10-%: Inert ingredients"

More at http://en.wikipedia.org/wiki/WD-40.

I was using mine today. Things were going great till it started vibrating! Must be an instruction manual around somewhere.

WD40 is indeed wierd. Checked it out too and discovered among other things S.G. of silcon oil is also less than water. Somebody lied to me many years ago. And to think I trusted him!?

2732. AWA Spring Meet

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-08 11:59:07 UTC
From: Diane & Edward Swynar
Topic: 2358 Message: 2732

Hi Guys,

Well, the XYL & I returned from the annual AWA Spring Meet in Bloomfield yesterday, after an absence of two years. We spent the night before in nearby Victor...I was there for the duration of the affair, having arrived on-site at around 7:45 AM, & departing just after the auction closed around noon, or so.

It was disappointing to see only a handful of vendors in the gym this year (3 - 4, tops...?), as compared to years gone by. There was more action to be had from tail-gaters in the parking lot of the school, with about a half-dozen vehicles set-up there. I detected a rather conspicuous absence in "traditional" ham gear both at the auction, & on the AWA "fire-sale" tables, as compared to what I remembered from before.

It was still fun, however, and the folks at AWA put on a nice presentation re. the new-and-improved museum facilities. I availed myself of the opportunity of renewing my AWA membership, purchasing three different editions of THE AWA REVIEW, & enjoyed pressing-the-flesh with stalwarts Ed Gable, Marc Ellis, & "Tireless Dave," perenial Sunday afternoom AWA AM net controller...!

The countryside at & around Bloomfield is just as pretty as ever, & the weather was fine...all-in-all, a good day!

Well, a lot of items that was once thought to be real scarce or rare, started showing up on eBay in larger and larger quantities. So, everyone who really wanted on got one, or lost out on one to a more aggressive bidder, but then got one later, so, the demand also went down. One good example is Vibroplex bugs. Even the common ones used to go for a nice amount, and now they no longer even get bids. As you can see, the one you pointed out went really cheap, although it was missing the cover. Ebay brought out a lot of stuff hidden in attics and so on, and items that we thought were scarce became not so much so. 73 - Mike

I don't use a bug on the air, although I can send halfway-decent with one.
For the amount of CW operating I do, I prefer the straight key.

If it has silicone, it must be part of the 10% "inert ingredients."

Yeah, if the water-displacement mechanism was that simple (the denser material displacing the less-dense), you'd be able to rinse out an oil can with water. As the kids say these days, "good luck with that!" ;-) I think it has more to do with surface chemistry - some key ingredient that will attach itself to a metallic surface and change it from hydrophilic to hydrophobic. Just a semi-educated SWAG on my part, though.

"Just a semi-educated SWAG on my part, though." Gee Larry - you have your degree in chemistry, do not put yourself down. I did real well in all my math/physics/EE courses both undergrad and grad, but, chemistry was never my favorite subject. Needles to say, I never did well in it or learned anything. Like anything else, you lose it if you do not use it. Fortunately I still use the stuff I liked on a daily basis for work, and, I even get paid for it J. At 66, I call it my "bailout" package, HI. 73 - Mike

As a matter a fact I did a little ZZZZZZing yesterday afternoon myself. After a hard morning working on my vintage dragster I fell asleep in the sun. I awoke in Ham radio mode and spent the afternoon trying many things. I have been run over a few times here by what sounded like a very local station. He drove by yesterday when I was doing some signal strength measurements to be sure my rig was working. (It is !;>) I saw the license plate so looked it up this morning. He is in this village but uses a PO box.
I have met very few friendly hams here. Very difficult to even get a hi and a civil greeting. I am not new to ham radio . Got 30 years + in. Stilll when I meet them here I feel like Joe CBer. Must be my square head or something.
Back in the day if you were a ham you were a friend and at the very least treated civily. Not so now!

Nope. But I know It is putting out . I did a signal check using a brick and my car and a receiver. I remeber when I first got my ham lcense. i came home all cranked , fired up the Viking II. It was almost a month before someone replied. Undaunted I send CQ till I get sleepy.

Well that actually works but it isnt instant. I do use it. i set the water in with the oil and leave it. Works for gease i on frying pan too. best way to watch it is put some oil in a glass jar. Dump it out leaving a residue and put in water. Leave it overnite . Observe in morning.

I reget I was unable to make my 8 pm sked. I did try at 9. What happened? Well I have a friend who was born in North Bay. He wanted to see South Bay. he doesnt drive. I promised last winter to take him there befoe i went to Germany. I had the afternoon free so i picked him up mid afternoon. We drove there and back. It took over 3 hours but I had promised my wife we would go to town for an ice cream cone when I got back. No problem . I figured we would be back by 7.45 but then she thought we should eat. Still ok. Took about 10 minutes at A&W BUT THE ICECREAM STORE WAS CLOSED!!!!!! Had to take her to DQ on the other side of town. An extra ten minutes added plus return. I knew I was beat and then we met one of her old colleques. I watched my sked drain away. My apologies. Wasnt how I planned it. I try to keep my word.
yes 3561. I was on at 9 and will go again at 10. No I wont have the tranciever on. I am committed to dual vintage ops. The regen can hear anything the Kenwood can anyway. Maybe more. At 9 I heard a KA8P -- and a WA2 on frequency after I had QRLd and sent a few CQs. They were having a bit of diffficulty but I know how exciting vintage ops are so i can understand it. When your little hunk of wood glass and metal starts to actually work sometimes you cant hear for your heart pounding in the headphones. It takes awhile to get settled down. I would have pushed a bit harder in town but it is Mothers Day. Sometimes you need to just suck it up and stay quiet.

I have been training on the "bug" today some. I have a buzzer hooked to it and am training myself to send on it only with my left hand. I have the hang of it. I just need to practice now. It is an astounding bit of mechanical design. it works so well it must have been discovered by accident. No one could plan this well. In its slowest mode it is maybe just a hair faster then I am comfortable with. I gues i will just have to stretch my comfort zone. I would like to be good with it.

While I have been touring around many websites looking for other Vintage ham operators I keep coming accross a fellows call sign who has been actively involved in vintage QSOs. It so happens it is also my experience to have had one with him with my vintage station. That would be Lou VA3AWA.
Thanks Lou for helping make this an active hobby.
to be fair I also had some qsos with the regen group. So often people dont answer.
Sometimes I hear them saying the next day on 20M " did you hear that guy on 80 calling CQ. I dont know who he is or I would have answered"??????????
I feel like breaking in and saying. "Why? You have a broken arm? How does it matter you dont know him?"
Anyway Lou is often up to give it a try. I appreciate it. Thanks OM. My vote for Elmer of the year.

You're doing very well to still be working at 66, Mike. I'm 54, and retired early last July. I may go back to work someday, but if I do, it will be part-time and probably completely unrelated to the semiconductor industry where I've spent the last 30 years. Right now I'm trying to catch up on things needing attention around the house, providing transportation for and generally helping out my Mom (who's 82 and lives across town), working on projects for fun (mostly old radio-related), and just living life! There's still never enough hours in the day.

Around 1992 I realized I didn't have the constitution or desire to do what I I was doing professionally until age 65 or beyond, so I had put a financial plan in place which came to fruition when I thew in the towel last year. I call IT my "austerity package." ;-)

And, Mike, if you are self-supporting, as you and I are, it ain't no "bailout!"

Hatched in NJ, but moved from there around age 6 or 7. Moved around a lot as a kid, went to 4th, 5th, and 6th grade in Brussells Belgium, Spent some years in Olean NY (western southern tier) before and after that. Last two years of high school were a bit south of Chicago, then lived in Urbana (where I met Elaine) from 1974 until the end of 1980, when I received the aforementioned BS Chemistry, landed a job with the first Fairchild Semiconductor, and moved to Maine.

Probably more than you wanted to know ;-)

I don't know how you guys worked so long. I threw in the towel at 47 after we sold the family business , (Ceretelecom Labs) to a company in the UK. Now at 61 I am still sipping off that. I have not once ever wished I had stayed working. And having said that I loved my career choice. Very interesting and rewarding but when my wife retired (teacher) a neighbour encouraged me to do so also and spend our retirement together. It was good advice. I dont have time to work! Looky here. I put my lost youth at the end instead.

Don will be using his "Modern" Quartz rig. Don is not yet thrilled with the performance of his TNT and is re thinking it slightly.
IE. It will light the dummy fine. Shoes up on the comercial Rx fine but it is a dial chord rig and you know--- So i used a sig gen to mark it , Checked it with my Transciever agaisnt the sig gen but When do a walk around I get more signal on the portable on 80 then forty. I have only 6 turns in the tank and 21 on the grid. about 5/8th dia. How that would produce a 80 m signal i dont know. I cant hear it on my digital rx in the bedroom . SWR is good on 40 (1.1 to 1SWR) Output is good on the meter, about 20 times scale wise of my 1 watt QRP tx (3 tran@#$%^&istor) Why it doesnt work like it should I dont understand. It will light the Rf bulb and shows on the meter but something is not right. And yetthe 40 M antenna works great with the Kenwood so I know it is OK.. I have just backed off a bit to think it through. If I focus on it too much I loose sleep, not good. I have learned to discipline myself so i backed of a bit to think about it. i learned to to that building race engines. You cant afford a BANG. Customers dont understand that. You have to figure it out before it fires. And I will.

Well Larry, it appears we went to school in the same part of the country. Received my BSEE from Indiana Institute of Technology located in Fort Wayne, IN. The grad courses were at Purdue and IU.

Of course I was only jokingly calling it my "bailout package", HI. However, since I am self employed and work out of my house, and love what I do, it seems like retirement and yet I get paid well for it. I figure as long as it lasts, I'll stick with it. I incorporated in 1996, so, have been on my own since. Nice not to have any of the corporate BS to deal with. 73 - Mike

I will continue trying to be there as well. Missed last night. Fell asleep again! My body seems to think we should be on summer schedule even though we're not due to equipment failures. Power equipment/tools, not radio equipment. I will still be receive-only though. Need somebody to give me swift kick in the behind to get on that antenna project. Actually I was planning to wait until after I'd done some tree removal in the area before putting an 80 meter antenna back up, because it will be hung differently once the trees are gone (and should work better). But with the equipment down, I guess I better do something temporary with the antenna.

If your like me I am not up to such heavy projects now. I have to find a willing slave to help. Last time it was my brother a retired Bell Tel emplyee who came here with his hi tech ladder and hung my 40 M V for me. i get nervous now justg oing up the front steps.
Don VE3LYX

BTW, My wife has been saving stuff for me for a POW radio. She gave me an old bird house. (Super disquise for a radio) and has been saving soup can lids for my tuning cap and regen throttle.I have heard a gridleak resistor can be made with a pencil mark and I have some old fence wire for coil winding. (it is still in the fence.) My two pals live on the entrance to the township dump and I asked them to see if a radio tube shows up in the dump. I want to make this from discarded scrap and see if it wlll work.
I have removed time from the equation. It will happen as stuff shows up. I want to try making the batteries too from jam jars and copper and maybe aluminum ot something also junk. Gives me reason to get up the next day.
Don VE3LYX (She just told me know I have enuf lids saved for both caps. which is what brought the subject up.)

If your like me I am not up to such heavy projects now.

Sorry to hear that Don. I'm very out of shape from inactivity during the winter, but I can handle the antenna project OK. I need to climb 75 feet to where the center of the inverted V is (or I should say where it was) and run new wires off the insulator. It's not a big job, just annoying. I usually forget something I need, and have to come down at least once to get more stuff. Today is out for sure. No way I could solder up there with the wind howling like it is.

I have some "heavy" antenna repair projects to get to as well, but I'm more into rig building right now. The TNT is coming along, although I'm on a break for the next couple of days awaiting supplies. Meanwhile I'm trying to tidy up my home a little... it seems to have become rather cluttered with vintage radio parts over the last few months! Now how did that happen?

Hi Dan,

Don't sell yourself short, just because you work in a field totally different from the one you were schooled in...! Such a scanario can actually be an advantage, in that---initially, at least---when confronted with possible solutions to problems, you may be more inclined to say, "Why not?" as opposed to simply "Why?" Specialized training/schooling has a way of "blinkering" one's outlook on things...

I'm living proof of that fact, I think: I majored in History & Economics in pursuit of my Bachelor's degree, & I ended-up working for some 34 years in one of the bigger of the "Big 3" auto manufacturers in North America. In that place my titles included Supervisor, Reliability Engineer, and Vehicle Alignment Co-Ordinator, among others...

I'm especially proud of that last one: I didn't know caster from camber from toe-in when they parachuted me into that position, but within a matter of months our plant had the absolute best warranty performance of ANY of our sister plants---anywhere. I guess I was just too dumb & untrained NOT to try different things---and lo & behold, the things that I did clicked.

As my former boss used to be fond of saying, "In this place you'll ALWAYS get the job you're least qualified for!" Maybe that's not such a bad thing after all.

Well Gentlemen - my degree is in History but I work as an Electrical Engineer. Go figure. My diploma shows that I could put up with college students for four years. 8^P

Where I went to college (U of IL Urbana) the coursework for the 1st two years was almost the same for all the science and engineering disciplines. Except, the 2nd year, in adition to the common physics and math courses, you would start to take classes in your own major people in other majors would not need.

> Needles to say, I never did well in it or learned

You're doing very well to still be working at 66, Mike. I'm 54, and retired early last July. I may go back to work someday, but if I do, it will be part-time and probably completely unrelated to the semiconductor industry where I've spent the last 30 years. Right now I'm trying to catch up on things needing attention around the house, providing transportation for and generally helping out my Mom (who's 82 and lives across town), working on projects for fun (mostly old radio-related), and just living life! There's still never enough hours in the day.

Around 1992 I realized I didn't have the constitution or desire to do what I I was doing professionally until age 65 or beyond, so I had put a financial plan in place which came to fruition when I thew in the towel last year. I call IT my "austerity package." ;-)

And, Mike, if you are self-supporting, as you and I are, it ain't no "bailout!"

73,
-Larry/NE1S

Thanks to a lead from Paul, N1BUG, I now have a tube I did not know existed, the UV-210.

"Initially being developed (start 1922) and employed as an output stage tube for loudspeaker operation (1924/ early '25), it was also used in transmitting service by the Navy (1924 beginning), because of its long life of about 15,000 hours. Power output 1.5 Watts."

Today, 7 minutes after returning from the PO, the new arrival was in Old Reliable, my TNT. The sig was just awful. Truly disgusting. Remember Larry's signal last December? Like that...

Having recently struggled with grid leak values verses sig quality during a new rig build, I replaced the recommonended 10K GL with a 50K pot. After increasing the resistance to what I later found to be 25 K, the signal became considerably more than OK even by Larry's exacting standards. Under a heavy load the output was 2 watts.

I replaced the UV with a UX for an output comparison. The "new" 210 delivered 3 watts out with the Va and load unchanged and with a much better tone then in the past with the new GL value. (Suffers of Rotten Sigs take heed.)

So, the UV-210 is a bit on the weak side, but still has a few QSOs in it yet. Looks good too...

You're welcome Lou!

Your report gives me a good data point on weak vs. strong 10s. I'll keep it in mind while on the prowl.

Please tell me about the pot used for picking the GL value. I understand GLs don't need to be non-inductive. Is a wirewound pot OK? I will soon be at the testing stage.

I'm glad that tube has some QSOs left in it.

> Larry's signal last December? Like that...
>

Hey, you had given my a good T report at the time, both on the air and discussing the QSO via Email later. And I monitor my own sig here on the RCVR (R390A). My sig was undoubtably worse and below my standards last nite - there was the wind, but also had a pair of globe 841s in the TNT instead of the '45s, and although I had adjusted the grid leak resistance appropriately, it's still not as stable (or efficient) as it was with the '45s*. I hope I can tweak it, but there may just be too much feedback with the 841s, which are much higher mu (30) than a '45 or '10, and have higher Cgp.

Anyway...

At NEARFEST (Deerfield NH) a week ago I picked up a FB Allen-Bradley variable resistor (not a "pot" since it only has two terminals) with a white ceramic body. I THINK this style was available in 1929, but not sure. Thinking about installing it in the TNT for the grid-leak so I can more easily swap tube types. I'll post a pic here when I get a chance.

The op you are working isn't going to hear the difference between 2 or 3 watts; just the difference in note...

73,
-Larry/NE1S

*the pair of 45s I used for years successfully in the TNT are no more. I have some others I can "borrow" from AM broadcast radios, but none of these work as well as the pair I had been using in the TNT. There's a sad, sad story that goes along with this: During Linc Cundall I had hastily switched between the 40M Hartly (using a '10) and the TNT to work W1ZB on 80M, forgetting to reduce the filament voltage at the (common) power supply appropriately. I realized it about 45 seconds later when I glanced up and saw the 45 filaments growing way too brightly. I had not keyed the rig yet, and instantly reduced the voltage to the proper 2.5VAC, but the damage was done. I didn't burn out the filaments, but had burned off the emmissive oxide coating, and neither tube has any emission left. They no longer function in RF or audio service. These were ST 45s. The globe 841s look much better (and are equally 1929 Bruce Kelley-appropriate); I have one in the Hartley working FB, but they're not playing well (yet) in the TNT.

A wirewound pot should be fine, as the inductance will look like a RF choke in series with a pure resistance. I'm not sure what the effect would be if the resistor inductance was self-resonant at the operating frequency, but the Q would likely be so poor that even that probably wouldn't be a problem.

IF you have available recommended class C operating conditions for a tube, you can calculate a starting point for the resistance = grid bias voltage/grid current. Then adjust for some kind of optimum between note, plate efficiency, and power output, without exceeding the maximum grid current. I understand RF oscillator service is similar to class C amplification in terms of tube operating parameters.

Hi Don!

As I had told Lou in QSO, I was going to pull the switch before then. I'm not much of a late-night operator anyway, and also I've been fighting something for the past week. I signed with Lou at about 8:25 PM, and was eminating ZZZZZs by 9 PM.

I copied your callsign a couple of times during your CQ, and also you were mostly copiable during one of your final responses to Lou, but otherwsie you were about 1 dB above mental telepathy at this QTH. Otherwise I would have called you for sure.

I heard someone in there with a glowbug at first but lost it. Lou was so ON freq he was in my null so I had to side step slightly. If I squeeze the phones cord hard I can wiggle about a 1/2kc so I do that for a lazy lads sweep. I use a regen for rx case you didnt know. I could put chokes in the phones line but then I wouldnt be able to do that. Tis a handy feature I find.
I would like to hear your rig so I hope we can do that . I may have to add a bit more power to reach. (voltage tripler instead of doubler?) or our QTHs may not coperate at these low levels of RF.
Anyway thanks for "being at the party" so to speak.
Don VE3LYX
You are 367 miles away apparently. My Dx record is 563 mi with this rig and ant.

I put the DX235 in my TNT yesterday afternoon. I put it on the Vibrator supply which is a bit lower B voltage than the doubler supply and higher than the Ac reg supply. DX235 are like Red Rose tea so if you dont recognize it dont worry.
It seems to be a good performer. Supply had trouble keeping up. It may be as simple as putting a stronger battery on it. I have iton a single gel right now and I can see the heater change colour when I key and hear the load change on the PS. I will put a voltmeter on the battery to see if that is so. it may also be theTNt with its floated cathode resistor network doesnt like a double grounded supply. If that turns out to be so I will float the battery input from the metal chassis.
When i fried my 171 I also hurt the Ac supply 6 volt. I think I know why NOW. Wont happen again! I hope to get the TNT working sufficiently well for a Qso also. I guess it wasnt last night on 7035.
I am going to look around for another DX235 and also replace my 171.
As for tubes of different eater values Lou asked me once why i have a heater control in my TX. That is why. I dont run anymore heater than necessary.

2795. Hartley project update

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-10 15:13:21 UTC
From: Terry Hall
Topic: 2795 Message: 2795

Good day, all

I wanted to give an update on my Hartley project. There are photos in the photo section if you want to take a peak at it.

My last post regarded the buzzing that I was getting after I started using my power supply. I believe that problem has been resolved. Larry NE1S was very helpful. Thank you, Larry. So far I have a good clear tone with the rig putting out about 3 watts.

The frequency does drift, though, and I want to make sure that this is "the way it is" when the wind is blowing the dipole antenna. The frequency was stable when attached to a dummy load, but when I plugged in the antenna, I had to follow the frequency shift on the monitor with the VFO. It is spring in Oklahoma after all with 20-25 mph winds today. Is this shift a normal occurance?

Terry

Thanks Larry. I have about a zillion pots around so I'm sure I can find something suitable for the purpose of determining an optimum GL value. I've found data for these early tubes pretty much doesn't exist, so experimentation seems to be the only game in town.

On a whim I just grabbed my 100K Bradleyohm to see if it might suffice. Actually I was wondering if it might even be suitable for permanent use in a transmitter. The answer I quickly arrived at is no. It seems to be able to handle the expected range of current OK, though it does get somewhat warm. However it doesn't hold to a particular resistance all that well, especially when it has a few mA current through it. It's not thermal drift, just instability, wandering up and down a bit.

73,
Paul N1BUG

A wirewound pot should be fine, as the inductance will look like a RF choke in series with a pure resistance. I'm not sure what the effect would be if the resistor inductance was self-resonant at the operating frequency, but the Q would likely be so poor that even that probably wouldn't be a problem.

IF you have available recommended class C operating conditions for a tube, you can calculate a starting point for the resistance = grid bias voltage/grid current. Then adjust for some kind of optimum between note, plate efficiency, and power output, without exceeding the maximum grid current. I understand RF oscillator service is similar to class C amplification in terms of tube operating parameters.

You're most welcome, Terry. Glad I was able to help and you got the problem resolved. What was the solution? Also, how much DC plate power in for that 3W out? (30-50% plate efficiency is typical, but it can be worse than that).

The antenna is part of the tank circuit that determines oscillation frequency in these rigs. So any change in antenna parameters affects the operating frequency. If it's wind changing the antenna loading, It'll shift both up and down in frequency with the wind, and repeat. If it's a constant drift in one direction, it's probably some part of the tank circuit heating up. Remember this could be the tube itself, as the internal capacitances become part of the tank circuit. I had both issues last nite, and today I was able to improve on the constant drift situation by tuning the antenna to the high side of the operating frquency (ant. tuned to 3650, rig on ~3560). Last night I had tuned the antenna up at ~3500. Of course the rig plate circuit needs to be tuned back to frequency after each adjustment.

2798. UV-210 or TU Bugsy & GL Test Observations

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-10 16:12:57 UTC
From: Louis Vermond VA3AWA
Topic: 2798 Message: 2798

I have about a zillion pots* around so I'm sure I can find something suitable for the purpose of determining an optimum GL value.

Paul & to whom it may interest....

The improvement to the TNTs signal began at 25K ohm**. I found in this and the other rig that the signal quality/output, at least by ear and my iffy watt metre, did not further improve
or change at all with an increase of GL resistance up to 90K. After that value, the tone/output started to diminish.

In short, the "best" GL resistance was fond to be very broad. Therefore, an installed GL pot is off little help and ...horrors...out of character for a late 20s rig. Mind you, very early amateur transmitters and regens pictured had variable gridleaks. This may have had something to do with band-change or rotten tubes of the day. ...Guessing.

Others may add understanding to this and, perhaps, refute my observations. I welcome both ...

73, Lou VE3AWA

I reget I was unable to make my 8 pm sked. I did try at 9. What happened? Well I have a friend who was born in North Bay. He wanted to see South Bay. he doesnt drive. I promised last winter to take him there befoe i went to Germany. I had the afternoon free so i picked him up mid afternoon. We drove there and back. It took over 3 hours but I had promised my wife we would go to town for an ice cream cone when I got back. No problem . I figured we would be back by 7.45 but then she thought we should eat. Still ok. Took about 10 minutes at A&W BUT THE ICECREAM STORE WAS CLOSED!!!!!! Had to take her to DQ on the other side of town. An extra ten minutes added plus return. I knew I was beat and then we met one of her old colleques. I watched my sked drain away.

Don, Remember the Babe movie sequel where the farmer is working in the water well? You've got that beat! Lou

This evening I installed a permanent 47K GL resister on Ol' Reliable. Had to try it out of course. With the UV-210 in place, I hit the key. Signal was OK, but perhaps a little rougher then the previous night. As VE7SL says, "These things change with the tides." He should know.

As I was about to switch things off for the night I recalled a test that I've been meaning to run.

While monitoring the signal I slowly reduced the 7.5 filament voltage. At just above 7V the signal suddenly changed from "OK" to gorgeous. Old Friend had not sounded that good since I ran the fil. & B+ off batteries. As I reduced the voltage further, the tone quality returned to its former self.

Why? Comments please...

GN, Lou
Tonight's scene.

While working on the rig tonight my nose was directly over the hot 210. Inhaled and suddenly it was 11:35 PM May 14, 1969 and VE3BDV was, at last, on the air.

Don, I listened but didn't hear you. There was a lot of SSB QRM on 7143 but even with the low power I think I should be able to hear something. I suppose it's possible propagation on 40 at that hour might be too long... you could be skipping over me. I wouldn't have thought so with the solar flux at around 100 but it has been too many years since I spent any real time on 40. I've lost touch with the band. Have a great trip! By the time you get back I will have an antenna up for 80 and may even have my TNT running on that band. It will be very low power with a UX-201A.

"While monitoring the signal I slowly reduced the 7.5 filament voltage. At just above 7V the signal suddenly changed from "OK" to gorgeous" LV

With the single tube regen UX201A it is also like that. Dropping heater voltage there is a sweet spot where the signal stands up.
Not a tx I know but basically the same circuit upside down. Theoretically reducing heater voltage is suposed to reduce volume but it doesnt on that set unless you go below practical levels. There is a definate sweet spot in heater supply voltage.
I suspect it is because they are directly heated tubes and the cathode potential or lack of it is intermingled with the heater circuit. Changing one affects the other even if minor. And since we often derive grid potential from the cathode supply to bring the tube into its operating range any change there also affects that. When playing with GLs on the regen I did a lot of measuring voltage accross the GL which is how I came to this conclusion.
Another problem I ran accross with my TNT and regen is most ac PSs and some dc PSs use a grounded B- and a grounded A- when in fact directly heated tubes prefer a b- and an A+ at cathode /heater or ground potential. As much fun as 1920s stuff is me personally I much prefer indirectly heated cathodes. However in the interest of being period correct and because I hate ever giving up I will make them work whatever it takes. Sometimes though you have to wonder , Where these circuits actually designed or are they accidental circuits that work? I may be wrong here but it seems this is why to me.

Possibly. Or perhaps a flakey connection (TR relay contact or switch) in
the antenna circuit?

> Anyone else been there?

May times, on many different rigs. Usually a dirty or otherwise poor
contact in a relay, switch, or connector, or a bad solder joint that
doesn't look bad on cursory inspection.

Yup, that's it exactly.

How?!! Define, "destroy".

destroy (vintage panel meter)
-verb

1. to mangle, bend, distort, harm, render useless

Guess I should have asked before trying it... what's the secret to getting these vintage Jewell meters apart????? Thy are unlike any meter I've ever worked on, and there have been dozens. Prying bends the back plate and damages the edge of the shell. Pulling requires extreme force resulting in meters taking flight when they finally break loose.

I think the solder jointswill get a rework. No relays or switches in circuit. Did a very slight mod tothe Ps and got voptage to 150. it barley moves on keying. (less than 5 volts drop on a 150 volts.)Out put is staying up .

Sorry to hear that, Paul. Put it away for a while, take your time, but don't give up.

Whenever I do a project I pretty much know what'll be involved before I start buiding it, and I try to "design around" areas where I have doubts about it being within my skill level or tools available - mechanically I'm somewhat of a klutz, and I don't have a lot of metalworking skill or tooling, for example. When I get to a place where I need to do something beyond my capabilities, I'm not shy about getting help from those who have the tools and skills I lack.

We've all been there!

From: Don
Topic: 2829 Message: 2829

I was thinking. (Always dangerous!)
When ireturn maybe we could go on 40 . I will use my big rig. Kenwood TS30S and make contact then have someone keep the frequency open and try the TNT on the same frequency. I will have to switch antennas so it will take a couple of minutes but it might tell me if it is doing the job or not. My antenna for 40 is on the west side of my house. it is there because there used to be a 220 feed going to the barn when I had cattle (yeah I forgot to tell that part of my life, Lou)When they removed the barn and 220 feed the bracket stayed there and it was a no brainer to put the 40 M inverted V on that bracket. It was only 14 feet from the shack. I say that because being an aluminum sided house it may block signals east a bit.

Thanks Larry.

Giving up is never an option!

With the exception of not being able to get those meters apart intact (that came as a real shock), I was apprehensive about two details of this project from the start. One was the wood. BUGs and wood are natural enemies. The wood turned out FB though. The other was brass angles. It's impossible to buy anything brass locally. After ordering two sets of brass corner braces online, I was not satisfied wither either type. So I ordered brass strip, but had my doubts about being able to bend and drill it repeatably. It seems my doubts were warranted. I need to save up and buy a metal bending brake one of these days. But that won't help with the drilling. I already have a drill press but it doesn't save me.

I know it's not in the spirit of 20s building, but when I return to the project I think I will take some brass strip and a diagram of what I want down to the local machine shop. I don't want to think about what that'll cost just yet but I'm sure the result will be worth it.

From: N1BUG
Topic: 2839 Message: 2839

Steve, Lou or anyone else with experience restoring meters...

I just couldn't leave it alone. I decided to practice painting meters on the ones I destroyed.

Is there any specific brand of masking tape/painter's tape you can recommend? I'll see if I can find it online. I've tried two different brands I could get locally. This tape is far too "aggressive". It sticks to anything and everything instantly and won't work into the L between the glass and metal. It won't cut cleanly with a razor blade - it rolls up in front of the blade. It has to be scraped off the glass, even moments after application.

BTW, the reason the meters were stuck and didn't come apart well was rust. Not much rust, mind you, but enough. The shell and the screw "tabs" on the meter assembly are both steel.

Citristrip is great stuff - love it.

Is there any specific brand of masking tape/painter's tape you can recommend?

The Scotch blue masking tape sold in the painting supplies section of bigger hardware stores. I use a toothpick to push the tape snuggly into the corner where meter shell meets glass. Trim with a razor blade or Xacto knife. If you clean the glass first, the tape will both apply and remove easily from the glass when you are done painting.

the reason the meters were stuck and didn't come apart well was rust. Nasty stuff that rust.

I agree on the blue tape although I have also used electrical tape. Always keep an X-acto knife handle with plenty of #11 blades handy. I never build anything without one. Use a brand-new blade when trimming the tape. Older blades can be used to scrape extra paint off the glass and scrape rust.

Thanks Steve and Dan.

Maybe I'm being too fussy? I tried electrical tape but no matter how I applied it or cut it there was a small, variable gap between the tape and metal. I will order some of the blue tape and X-Acto blades, then try again.

All,

I am working on an article for the AWA Journal whose subject will be a 1930s vintage 112 Mc/s transceiver design which uses a single type 76 triode as a superregenerative receiver for RX and as a grid-modulated oscillator (with carbon microphone into a suitable step-up xfmr) on TX. There were no additional tubes for modulation or audio amplification, and it was intended to be run from batteries. This circuit was published several times in the "Question Box" column of Radio and Television magazine, which was a Hugo Gernsback publication, but I am trying to find out where it was originally published, and by whom, or any other places the circuit may have appeared or was discussed.

Any fruitful leads would be gratefully appreciated and will get honorable mention in my article.

Thanks!

Topic: 2843 Message: 2845

I have Editions 2 & 4 and 6-23 of the Radio Handbook. No 1st. Notice in 2nd Edition says "The work (1st edition) was printed in comparatively small edition in order to determine the requirements of the amateur ..." so may never find one of those.

The 2nd, 1936 edition Published and Copyrighted by Pacific Radio Publishing Co., San Francisco. I don't have a 3rd, 1937 edition. The 4th, 1938 was Published and Distributed by Radio, LTD. Interestingly the 5th that I don't have would have to be squeezed in between the 4th, 1938 and the 6th, 1939.

There was supposedly a 1937 Supplement "Supplement to Frank C. Jones Radio Handbook 1937" and a second 5th,1938 edition, but I haven't seen either. The 5th edition was the first edited by W W Smith. Jones may have transferred the copyright for the 1936 and 1937 issues to Radio LTD after the second printing of the 1937 edition.

The 6th edition was the last to be "Published and Distributed by Radio, LTD." First printing October, 1939, edited by W W Smith. The 7th edition, first printing October, 1940 was the first to be published under the "Editors and Engineers, LTD" name, but with the same 1300 Kenwood Road address given for Radio LTD in the 6th edition. The Editor is now Ray L Dawley, with W W Smith as "Editorial Director". The 7th is also the first one that I have that is cloth bound. All subsequent issues are cloth bound and I think that's all that was offered from then on.

The 8th edition, October, 1941, (Dawley and Smith); 9th, November 1942; 10th, 1946, (no Editor listed, just contributors, including Dawley, Smith, Jones and others; 11th, 1947; 12th, 1949 and 13th, 1951 (Dawley again as Editor) were all "E & E" at 1300 Kenwood Road. There is an interesting "NOTICE" in the 12th. "This all-constructional 12th edition does NOT supersede the 11th edition which contains entirely different material and remains current".

The 14th, 1956 is still "E & E" but at a new Summerland, CA address. This is the first with Bill Orr as Editor. The 15th, 1959 and 16th, 1962, are the same.

The 17th, 1967, is "E & E" but at a "New Augusta, IN" address. The 18th, 1970 is the same.

The 19th, 1972; 20th, 1975 and 21st, 1978; are all published by Howard W. Sams, Inc., Indianapolis, IN.

The 22nd, 1981 has a notation "Edited by Welborn Associates" with a preface by Bill Orr. Orr's name is still on the Title page, and one of

the contributing editors is listed as Bob Welborn, W9PBW. Other contributors include Stuart Cowan (CQ Magazine); Jim Garland, W8ZR; George Jacobs, W3ASK; Ed Marriner, W6XM; Jack McCullough, W6CHE (The MAC from EI-MAC); Hank Olson, W6GXN; Bob Sutherland, W6PO (EIMAC); Skip Tenney, W1NLB (Ham Radio Magazine); and others I don't recognize off the top of my head.

The 23rd (and final?) edition, 1986 also is edited by Welborn Associates and with a Foreword by Frank C Jones, W6AJF and Preface by William I. Orr, W6SAI.

So. More than you ever wanted to know!

Garey & Roger, thanks for the info. I have the '36 reprint and orig '37 HB with '37 supplement. Lots of good projects, but the tubes are pretty much out of sight...hi. I was wondering what other editions were printed and that's been answered...Tnx again and 73, Bill K4JYS

Hi Garey,
I'll see if I can find my '37 supplement. There wasn't much to it anyway. Some used to sell reprints of the '36 handbook but I haven't seen them in a while.

I have Editions 2 & 4 and 6-23 of the Radio Handbook. No 1st. Notice in 2nd Edition says "The work (1st edition) was printed in comparatively small edition in order to determine the requirements of the amateur ..." so may never find one of those.

The 2nd, 1936 edition Published and Copyrighted by Pacific Radio Publishing Co., San Francisco. I don't have a 3rd, 1937 edition. The 4th, 1938 was Published and Distributed by Radio, LTD. Interestingly the 5th that I don't have would have to be squeezed in between the 4th, 1938 and the 6th, 1939.

There was supposedly a 1937 Supplement "Supplement to Frank C. Jones Radio Handbook 1937" and a second 5th,1938 edition, but I haven't seen either. The 5th edition was the first edited by W W Smith. Jones may have transferred the copyright for the 1936 and 1937 issues to Radio LTD after the second printing of the 1937 edition.

The 6th edition was the last to be "Published and Distributed by Radio, LTD." First printing October, 1939, edited by W W Smith. The 7th edition, first printing October, 1940 was the first to be published under the "Editors and Engineers, LTD" name, but with the same 1300 Kenwood Road address given for Radio LTD in the 6th edition. The Editor is now Ray L Dawley, with W W Smith as "Editorial Director". The 7th is

also the first one that I have that is cloth bound. All subsequent issues are cloth bound and I think that's all that was offered from then on.

The 8th edition, October, 1941, (Dawley and Smith); 9th, November 1942; 10th, 1946, (no Editor listed, just contributors, including Dawley, Smith, Jones and others; 11th, 1947; 12th, 1949 and 13th, 1951 (Dawley again as Editor) were all "E & E" at 1300 Kenwood Road. There is an interesting "NOTICE" in the 12th. "This all-constructional 12th edition does NOT supersede the 11th edition which contains entirely different material and remains current".

The 14th, 1956 is still "E & E" but at a new Summerland, CA address. This is the first with Bill Orr as Editor. The 15th, 1959 and 16th, 1962, are the same.

The 17th, 1967, is "E & E" but at a "New Augusta, IN" address. The 18th, 1970 is the same.

The 19th, 1972; 20th, 1975 and 21st, 1978; are all published by Howard W. Sams, Inc., Indianapolis, IN.

The 22nd, 1981 has a notation "Edited by Welborn Associates" with a preface by Bill Orr. Orr's name is still on the Title page, and one of the contributing editors is listed as Bob Welborn, W9PBW. Other contributors include Stuart Cowan (CQ Magazine); Jim Garland, W8ZR; George Jacobs, W3ASK; Ed Marriner, W6XM; Jack McCullough, W6CHE (The MAC from EI-MAC); Hank Olson, W6GXN; Bob Sutherland, W6PO (EIMAC); Skip Tenney, W1NLB (Ham Radio Magazine); and others I don't recognize off the top of my head.

The 23rd (and final?) edition, 1986 also is edited by Welborn Associates and with a Foreword by Frank C Jones, W6AJF and Preface by William I. Orr, W6SAI.

So. More than you ever wanted to know!

Corrections? Additions?

2850. TNT first test...

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-17 23:52:20 UTC
From: N1BUG
Topic: 2850 Message: 2850

...or, new kid has some investigating to do!

I wired up the TNT today, plugged in a '201A and applied power. The good news is it does oscillate! The bad news is, only around 4.6 MHz. That's a bit surprising, as I have 64 turns of #30 d.c.c. wire for the grid coil, on 1 inch diameter bakelite tube. There is a rather broad dip in plate current around 4.5 to 4.7 MHz. If I tune outside that range, the current goes up suddenly (NOT smoothly) and it appears to drop out of oscillation. Either that or there is a very large instantaneous frequency jump and I haven't discovered where it goes yet. The tuning condenser is about half meshed (~250 mmfd) at 4.6 MHz.

Should I expect to see much change in plate current with changes in loading? With 180 volts on the '201A, it's about 12 mA with the antenna coil at right angles to the tank coil, and only goes to 13 mA with the coils almost touching.

I also suspect power output is negligible, as there is NO detectable heating of a 2 watt resistor I'm using as a load.

Any comments?

73,
Paul N1BUG

You may need more turns on the grid coil*. You want the grid coil plus parasitic capacitance in the circuit (mostly distributed capacitance in the coil plus the Cgk of the tube) to be resonant slightly below the operating frequency, so say a bit below 3.5 Mc/s for the 80M band (say, around 3.45 Mc/s?). Do you have a grid dip oscillator so that you can determine the resonant frequency of the grid circuit? In the TNT the grid circuit is low Q so the dip will be broad, but the minimum should be below 3.5 Mc/s. While you're at it, dip the plate tank circuit and make sure it resonates at 3.5 MHz at some setting of the condenser, and note that setting. The plate tank circuit dip will be much sharper because of the high Q.

*I'd look up the specs for the grid coil for the TNT described in the 1930 edition of "How to Become a Radio Amateur" published by the ARRL, but my son's girlfriend stayed over last night and is presently sleeping in my "library." So I'll post that info later today.

Describe the diameter/material/ # turns on the plate coil. On these rigs, usually the plate coils are designed to hit the frequency of operation with the tuning condenser plates nearly fully meshed on 160M, 80M, and 40M, to maintain high Q, which is important for stability and purity of note (such as it is). So if you followed a TNT "recipe" for the plate coil for 80M I would expect you would want the resonating capacity to be in the 350 - 400 mmfd range (condensers are measured in mmfd, while capacitors use pF ;-) !).

Finally, how are you measuring the frequency? Superhets can have strong spurious responses, and frequency counters can easily display an erroneous frequency, too. I've been fooled by both. I find the most unambiguous method is to use an old frequency meter, which consists of a well-shielded and calibrated regenerative detector. In my case it's a WWII-vintage LM-5.

I think you should see a much greater difference than that. What are you using for a load, and do you have a variable condenser in series with the antenna coil so that you can series-resonate the combination? On my TNT I see an increase of maybe 15% in plate current when I simply couple the plate tank to a single loop connected across a pilot light.

> I also suspect power output is negligible, as there is NO
> detectable heating of a 2 watt resistor I'm using as a load.
>

With a 201A set I expect this is normal. I get minimal heating of my 2W grid-leak in my PP '45 TNT, which runs significantly more power than a single '01A.

I don't have a grid dip oscillator as such. I hate to even say this
in ref. to '29 gear, but... I do have an MFJ 259B antenna analyzer
with the grid dip coil accessory. However I've never tried using it
in that mode and frankly have little confidence in it.

> *I'd look up the specs for the grid coil for the TNT described in the 1930
> edition of "How to Become a Radio Amateur" published by the ARRL, but my

That article specs 60 turns #30 d.c.c on 1" diameter form.
I have 64 turns #30 d.c.c on 1" diameter bakelite tube.

Silly me was hoping the 4 extra turns would get me well below 3.5 Mc.

I put a small "gimmick" condenser across the grid coil using strips
of aluminum foil (!) and the plate current dip / RF output moved
down to 3.9 Mc.

> Describe the diameter/material/ # turns on the plate coil.

Exactly as per article. 12 turns 1/4" copper tube, 4.5" long, wound
using 2-3/8" OD pipe.

> Finally, how are you measuring the frequency?

Crudely! Using a superhet rcvr. I tuned from 500 Kc. to 30 Mc. and
found just ONE signal emanating from the TNT... around 4.6 Mc. as
described. It's plenty strong, and I find no other spurs or anything.

> I think you should see a much greater difference than that. What are you
> using for a load, and do you have a variable condenser in series with the

Currently I don't have the variable condenser. I will try that
before I make any other changes. Correction on the load. I said 2W,
but in reality it is a 56 ohm 1 watt carbon comp resistor.

> With a 201A set I expect this is normal. I get minimal heating of my 2W
> grid-leak in my PP '45 TNT, which runs significantly more power than a

> single '01A.

I'm referring to a resistor used as an RF load, in place of an antenna. With 180V at 12 mA that is 2.16 watts input power. I would expect at least half a watt out, no? Half a watt into a 1 watt carbon comp should warm it up nicely. Nada. No heating. I will go get a variable condenser to put in series with the antenna coil.

Paul

2854. TNT "grid dips"

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-18 12:41:01 UTC
From: N1BUG
Topic: 2850 Message: 2854

I just dragged out the MFJ 259B with grid dip accessory. It does appear to do something.

With the TNT still tuned up at 4.6 Mc., dipping the plate tank I see a sharp dip at 4.6 Mc.

Dipping the grid coil I see a broad dip at 6.6 Mc. and a sharp dip at 4.6 Mc. The 4.6 Mc. dip seems to be the plate tank, because varying the tank condenser moves it. The broad dip at 6.5 Mc. is not affected by changes in plate tank tuning. Surely this grid coil cannot be resonant at 6.6 Mc.?

The plate tank will go down to 3.46 Mc. with the condenser fully meshed. At 3.5 Mc. it is ~95% meshed. So it will get there, but seems to be requiring a bit more capacity than expected.

More later. I have to go remove the bench vise from the middle of the living room floor and the pile of tools from the kitchen table before company arrives! :o)

OK, Paul, FB on all, and on following the coil specs for the 1930 "How to Become a Radio Amateur" rig entirely, save for the 4 extra turns on the grid coil. I just compared Cgf, Cgp, and Cpf between the '10 and -01A, and there's not much difference: 4, 7 and 3 uuF, respectively, for the '10, vs. 3.1, 8.1, and 2.2 uuf, respectively, for the '01A. Plus the original article implied no changes (other than supply voltages) were necessary in the circuit to use a '01a in place of the '10. So that's probably not the issue.

Check your grid coil for continuity, to make sure there's not a break in the winding, and all connections in the transmitter as well, for continuity. Make sure the tube pins are clean, and you may want to heat up the pins and apply some fresh rosin-core solder to the end of each pin (or try a different '01A, if you have one, or a '71A, or a '45).

A single loop of wire connected to a flashlight bulb or pilot light (I'd use a 60 mA bulb for the sing;le '01A power level) can be helpful in diagnosis, too, bought in close proximity to the tank coil.

Wish you were closer, you could bring that thing over here and I'd bet we'd have it on the air within the hour.

Thanks for all the suggestions Larry!

I knew I forgot something critical when buying parts. Now I remember
what it was! Flashlight bulbs!

I discovered one more thing while playing with the dip meter.

I now have a variable condenser in series with the antenna coil.

With the MFJ coupled to the tank coil and the tank resonated at 3.55
Mc., I can adjust the tap on the antenna coil and series variable
condenser so that the MFJ 259B "sees" the 56 ohm antenna load
resistor. I can get to almost perfect 56 +/- j0. Interestingly, at
4.6 Mc. I cannot get close with any amount of adjustment. Perhaps
the tank and antenna coupling circuit isn't capable of efficient
power transfer at the higher frequency. This might explain the
apparent low output.

I will check all connections later and see what happens. I have
three '01A tubes and have tried all of them. All behave almost
identically, for whatever that's worth. One is a Sylvania. The other
two are Cunningham.

There's a lot of pondering and head scratching going on here in Milo too.

I checked all the connections, and all seem fine. For sake of experimentation I made the TNT into a TPTG. It tuned up FB on 3.56 Mc. Not more than about 15 mmfd required, if that. It soon became obvious the tuning of the grid circuit affects power output quite noticeably. I can see some indication on my RF milliammeter now, and the load gets slightly warm. I guesstimate I'm getting about 0.15 watt out, running 2.4 watts input. Still not right.

I just exchanged the 10K grid resistor for a 47K. Wow. The note got MUCH better, input power decreased to 1.8 watts, output increased to a guesstimated 0.25 watt. Fascinating. I'm off to find a potentiometer to stick in there for further testing!

...sort of. It's working but not really a TNT at the moment!

Success with the TPTG configuration. I'm getting something in the vicinity of 0.5 watt out with 1.8 watt DC input. Loading is at maximum to achieve that. Note sounds FB to me. The optimum GL for this Sylvania SX-201A seems to be around 50K ohms, with very little change in the range 30K to 70K ohms. Power output drops off on either side of that range, and on the low end note gets rough as well.

So, I guess I will be winding a new grid coil with more turns.

Yup, long delayed echo. Your signal went 'round the galaxy and came back, OM. :0) Apparently it's just as true for the lowly '01A as for the type 10 tube. And I'm sure it will hold for the TNT configuration as well.

Congrats! Great progress. Wanna try for a QSO, or are you still antenna-challenged?

That kind of plate efficiency is very similar to what I get on my TNT, Hartley, and an XTAL osc. directly into the antenna.

Sounds similar to my experience, too

> So, I guess I will be winding a new grid coil with more turns.

Sounds like a good plan to me.

I was just sorting through my tubes looking for a pair of 1619s I KNOW I have, but can't locate at the moment. I know I've come across them in the past few months, too. I want to try one connected as a low-mu triode to see if it will make a suitable substitute for a '45 in audio service. If so, I'll wire up a pair of adaptors.

Anyway, no joy in finding the 1619s, but I came across a pair of globe '71As, and just tried them in the PP TNT. 5W RF out for 15W DC in, and note sounds reasonable, betty, I think, than the 841s. I think I'll use them there for a while.

Lou -

These look real familiar to me. I know they do not completely unscrew, due to the design. The manufacturer eludes me, but, it seems they were used on some of the BC-114A and BC-15 radios. GR or deForest, maybe Firth. Seems I have also seen similar posts on early instrumentation like resistive bridges and the like. 73 - Mike

Subject: [AWA Group] Binding Posts?

Hello,

Can anyone tell me the manufacturer of these somewhat common binding posts?

Tks, Lou

I'm still antenna-challenged. I've been hoping for a dry, reasonably calm day. If that doesn't happen soon I guess I will get up there and see what I can do in the rain!

> I came across a pair of globe
> '71As, and just tried them in the PP TNT. 5W RF out for 15W DC in, and
> note sounds reasonable

Great! Can you give voltage and current for that 15W DC in? That would be a nice data point for my notebook. Maybe I should give in and buy a '71A. That's a lot more power than my mighty '01A and a lot cheaper than a '45 or a '10.

I should probably pick up 2 spares, too. I'm not sure what they go for these days. I have a Radiola 17 in the living room that uses one as the audio output, plus a junker three-dialer that is begging to see new life as a 1920s Heising-modulated AM or CW MOPA. In this project I plan on using a 112A as a Hartley oscillator into a 71A PA; pair of 201As cascaded low-level audio into 71A Heising modulator. (See, for example, Louis F. Leuck, "Making a Short-Wave Transmitter from a Neutrodyne,"1934 Official Short Wave Radio Manual, Gernsback, pp32-34.)

Speaking of the 112A, if you can dig up one of those, its power output capability is between a 201A and 71A. It also has a 5V filament and was used in the audio output stage of 1920s broadcast radios.

Thanks!

I just bought a globe '71A which I anticipate having in my greedy
paws early next week. I'd been holding out for a '10 but the reality
is that's not going to happen any time soon.

Paul, regarding the "Neutrodyne" 'Fone rig in the 1934 Shortwave Craft article, I've seen that article and it just goes begging to be built. I have a number of "Three Dialers" in various states sitting around here I could use.

Obviously it would be a 160M self excited oscillator, but a power supply wouldn't be that difficult to come up with. I think he used the existing audio transformers for a speech amp and mod transformer. It sounds like most of us on this list probably have the parts to build it on our junquebox an d don't even realize it.

If you build one, please let me know how it turns out, and what kind of power output your particular transmitter makes. My email address is good on this list and QRZed dot com. Ditto on contacting me if you need anything to build it!

Add a double button carbonium microphonium, and a blooper "sucker-inner", (Particularly the one in the 1930 "How to become a Amateur" Handbook) and you have a authenic early 1930's fone station.

Mod-U-later,
Joe Cro N3IBX

It was I who brought up this rig and said I had intended to build one. If Paul, you, or someone else does too, so much the better! ;-)

> Obviously it would be a 160M self excited oscillator, but a power supply

>

Actually,the author used a 30 Hy choke as a modulation reactor. The receiver audio transformers were used between the '01A 1t audio and '01A second audio, and between the '01A second audio and '71A modulator. You might think you could use the primary winding of one of these audio transformers as a modulation choke, but it needs to pass the DC plate current of both the modulator and RFPA, so the core would probably saturate (best case) or, more than likely, the winding would burn out in short order. These transformers were often "underbuilt,"failed oped even when used in the intended application.

He also used a telephone induction coil for the "carbonium microphonium" transformer.

> If you build one, please let me know how it turns out, and what kind of
> power output your particular transmitter makes. My email address is good
> on this list and QRZed dot com. Ditto on contacting me if you need

OK! Could be a few years, but you never know when I'll rearrange the planned project list and one further on down will bubble to the top.

> Add a double button carbonium microphonium, and a blooper "sucker-inner",
> (Particularly the one in the 1930 "How to become a Amateur" Handbook) and
> you have a authenic early 1930's fone station.

The author of the article being discussed used a single-button mike, but if you have a double-button one and a suitable transformer for it it's

just as authentic. Not sure what the advantages of the double-button are, perhaps more output and no net magnetization current in the xfmr core?

Hi Joe and Larry,

> It was I who brought up this rig and said I had intended to build one. If
> Paul, you, or someone else does too, so much the better! ;-)

I'd be interested in reading the article, and it sounds like an interesting project, but one that would have a hard time finding its way to the top of my list. I would be starting completely from scratch on parts, as I probably don't have any of them.

> OK! Could be a few years, but you never know when I'll rearrange the
> planned project list and one further on down will bubble to the top.

Ha! Sounds kinda like my project list. After I finalize the TNT, I have two more transmitters, one receiver, and two or three power supply projects currently on the list. The order in which they get done will probably depend on what parts I find first. All the major parts are already in hand for the transmitters and receiver, just a few relatively minor bits to locate. The power supplies are another matter entirely and will likely be some time down the road... and not strictly vintage due to runaway costs of all this. ;-)

BTW Larry... My antenna repair project yesterday was a resounding failure. On the first attempt I had a minor (?) medical issue stop me half way up the tower. I got a second chance later in the day, completed repairs only to have it fall an hour later. The wire broke in a different spot. This morning I see it's broken on the other side again too. It's time to admit that antenna and most others on that tower are a total loss. One inch radial ice, falling trees, towers, and antennas just do not mix well. As soon as I get another break in the weather (possibly today, if the forecast is correct), I will begin stripping that tower in preparation for what's really called for... a complete rebuild. Meanwhile, I will have a look around to see if there is any possibility of stringing a quick 'n dirty, temporary, low 80M wire someplace! TNT almost ready! Need an antenna!

My globe '71A has been shipped. I expect to have my paws on it Monday!

I so feel you pain with the new tnts.
The advice about spotting with a Superhet is so absolutley corect. They are about useless for that because of the image thing (I think they are anyway but that is just me.) I spot with a signal generator (Period correct antique one of course!)and then match to the Rx. I use for the 80 tx a low power crystal osc for spotting Very low power. It can be very taxing on ones calmness setting up a tnt tx. Best thing you could have is a friend about 5 miles waswy with a good rx. My brother has an ancient Stewart Warner Navy Receiver and lives 5 miles away. I asked him for help two months ago and he said maybe he could do the sometime. "Sometime" has never arrived. I think though a couple of the group here are due south of me accorss the lake in the Rochestor area. And that might work for me. I though should have and do not have a simple GDO.For most of us too we would only need one coil instead of all the set. 80 or 40 M would do. I thought about making a crystal set to spot the tx with. at least ot be safe "in band" which is one of my biggest worries.
Don

Yeah or Ja.
I went to the sinsheim museum. They had a signal room there and I took a lot os pictres through the glass.
Neatest part was were were on a Danube (Donau in Germany) boatcruise . We went under a bridge and a fellow waved to the captain and owner of the small cruise boat from the bridge. He set his mike down on the wood and clearly tapped out a "dit diddahdit dit sharply on the wood. I called cq de VE3LYX from my table by tapping. I was too far away to talk to him but I could see he heard it right away and turned his mirror from the brridge till he could see who was sending. He was a regular one man show. Sailed the ship, gave the tour and played the accordion to entertain passengers when the bar tender took the wheel for a miniute or so in the centre of the wide spot of the river. When we disembarked he was playing the accordion for our entertainment. I went by him I said 73s. He immediately smiled and gave is head two very long and distinctive nodds. I took down a bit more info from the advertisng for the tours and will find our who he is and what his call is.soon.

Welcome back Don.

I so feel you pain with the new tnts.

The advice about spotting with a Superhet is so absolutley corect. They are about useless for that because of the image thing (I think they are anyway but that is just me.)

It depends on the superhet. My [very] modern one certainly has its evils but images are not one of them. It is an up-conversion design with the first I.F. at 69 MHz and crystal filter in that first I.F. to prevent anything unwanted from reaching the second or third I.F. It's not exactly in the spirit of vintage radio but is useful for spotting. Ironically I owned a GDO for years. In my hands that was a truly useless instrument. I finally got rid of it.

The TNT works fine with the '201A but only makes about half a watt output power. The '71A I bought was wasted money as it doesn't fit the socket I used and I'm not inclined to change sockets. Now that I'm aware of that problem I can't verify that any of the current '71A offerings would fit either, so I'm not planning to try again. I guess you guys will just have to tweak your antennas and receivers to pull in my whopping signal. :o)

Hmmm, that's odd. All the UX171A examples I have here have the bayonet pin and will fit the old bayonet sockets (like I have in my Hartley) as well as the more modern styles which only accept UX-type bases (which are in my TNT). I've used '71As in both transmitters. I certainly don't disbelieve you; you're there and I'm not.

Had a nice 40M QSO on 40M yesterday AM on the Hartley with an 841 in the socket.

It's a Majestic G-71-A, globe shape. It does not have the bayonet pin, and the base diameter is slightly too large to fit in the bayonet socket. I thought about buying a Cunningham CX-371A yesterday but after this experience I'm reluctant.

> Had a nice 40M QSO on 40M yesterday AM on the Hartley with an 841 in the

Great! I watched a UX-841 on eBay for a while, but recalled your earlier comments about that tube. The price was about two thirds what a good UX-210 usually goes for so I decided to skip it.

One of these days some unsuspecting new seller will list a UX-210 with a too-low Buy It Now price and I will pounce. Well, I can dream, can't I? :-)

Topic: 2890 Message: 2890

I have my 40M on ac power now. It seems to be putting out a decent amount on the meter with a good ant match. Have called CQ at the top of the 40M CW band last night and this morning. I see a few of you work 40 m as well. Where should I be freq wise?
AC PS is very stable voltage wise. Voltage drop on keying is minmal. maybe 5 to 8 volts. It took a slight mod to get there. I eliminated a resitor in the B + side with a jumper wire and voltage came up slightly but voltage swinging all but stopped.
I have the filments on Ac but it was wired for that with a resistor split feeding the Cathode . I also have Dc on this supply for heaters but voltage is a bit high. Am working around that design flaw now. Easy to forget when building an ac powered PS that voltage goes up when rectified to Dc and filtered. I think I would like to put in a clamping resistor to pull it down a bit and stabalize it.
IBTW am now using the bug daily. I am beginning to get the hang of it.
Don VE3LYX
If anyone is doing a 40M op I would like to at least listen in if you dont mind.

I subbed the ux201A from my regen just to see this morning. Was surprised to see it is a much better tube than my 235. Almost 2 watts and over a broader range too.
I bought a pair of 50L6s for my other rig as I had a mishap the day I left with it. (Accidently pulled ant wire out of a binding post but didnt see it while changing antennas. I heard a soft ping and then nothing.)

Don,

Can you tell me how much plate voltage and current you are running on the UX-201A? My TNT on 80m with that tube will not make more than half a watt output, running 200 volts and 10 milliamps. The antenna coil is coupled as tightly as it will go, almost touching the tank coil. I'm still not sure if it is OK or if there is some problem with it.

If your maximum output is occurring that low in the band perhaps the grid coil is resonant a bit low in frequency? My grid coil was resonant too high so I temporarily converted my TNT to a TPTG by putting a variable condenser across the grid coil. I've noticed the tuning of the grid circuit has a pronounced affect on output as well as signal quality. Best quality and maximum output seem to occur at about the same point.

Hi Guys,

I have no ties or association with the seller of this item whatsoever, but I must say, this particular edition of THE ARRL HANDBOOK was ESPECIALLY useful & informative to me when I first ventured forth into the wonderful word of homebrewing 1929 classics some 15 years ago:

http://cgi.ebay.com/ARRL-RADIO-AMATEURS-HANDBOOK-1931-8TH-ED-230-PGS-CLEAN-/160591498115?pt=LH_DefaultDomain_0&hash=item2563ffcb83#ht_1299wt_1141

It'd be a most welcome addition to the library of fans of "...radio things 1929-ish"---you'll find yourself continually referring back to it, as I did & continue to do, to-day...

Hello Paul,

I hope this won't muddy the waters, but this thread has gotten me interested in rechecking my 80M TNT. I built it around 2000 or 01 and used it in several AWA '29 Party's with good success for what it was. Each contact with it and now a '29 Hartley is a 'goose bump' event...very exciting and amazing to be heard with a twenties technology xmtr.

If I remember correctly, I started out running around 170 vdc at about 12 ma on my TNT (and made plenty of contacts), using a CX-301A tube. Over the years I have cautiously raised the B+ to around 260-280 vdc (still using the same tube). I recently moved the setup to a new shack which increased the feed line length a bit and for some reason the plate current is now up to around 28 to 34 ma, depending on which tap I use for the antenna connection. I'm sure this is pushing the '01A past its limits, but you know how we hams are...mo power.

I built mine from the Dec 1929 QST article...and maybe that's where yours came from. Not wanting to deviate from the article, I also used the antenna suggested, a off center fed hertz (now known as a Windom). I just tap the feed line to the best turn on the tank coil (thru a stopping condenser to keep B+ off the antenna), usually around the 5th or 6th turn from the top of the coil. The sig is pretty steady, if there are no vibrations or wind blowing the antenna. I find this antenna works great for the TNT and Hartley as well as several other HB one tube oscs.

I don't recall why, but I have around 66-70 (article calls for 60) or so turns (hard to count 'em now) and it dips at 5.8mc, w/tube in socket and turned off. The tank condenser has no effect on the dip. I shorted out the grid leak/cond. and the dip went down to 5.2 mc. I'm thinking the dips may not be around the expected freq, but it works.

I would like to, maybe, get it peaked up properly and this thread may help me to do some tweaking. Keep plugging away. I have enjoyed your comments and those of Larry and others....73 de Bill K4JYS

I have a 1948 ARRL handbook.
At the begininng of the HF Transmitting section under VFOs (forst pages in the section) there is a good detailed description and specs. . It is plate 632 D if memory serves me. The accompanying paragraph or so says in block letters TPTG. I would impagine it is all the books of tube era. Say 40s to early 50s and maybe more.

I didnt measure current and I am using a Radio shack meter but it is bouncing the field strength meter which is not near the tx so I am ok with that. My voltage key down was 147 volts. The 235 would light the sniffer but then fade . the UX201A Does not. I use an Rf sniffer too and find it very helpful.
Here is what I know from my experience.
There is a sweet spot whre power is good. Usually it is quite narrow. I assume it is where the grid coil and tanl circuit are both happy at the same time. You have to play with the grid coil some. I have dropped a couple of turns from mine and will probably remove one more although a 1/2 turn would be super. My sweet spot is 7005. I dont like it there as it is too close to band edge. I can sneak up to 7099 and still have some power but it falls at an alarming rate.
Different tubes also affect the sweet spot and tuning some because they have different internal capacitance. I have been right where you are with this rig.
Since last night I tried the 235 , the UX201A and now I have a 45 in it. Power is almost 2 3/4 watts.
I just did a test for you right now. first the 235 then the UX201 , then the 45.
Same radio same power supply , same antenna, same meter usw.

I will post the meter fotos in a minute or so. I touched nothing . no retune, no nothing just changed the tube and hit the key.
An inline meter as I am sure you already now is also a big help in finding the happy place.
My sweet spot would be less than 50 Kc wide if you are talking about good power output.

Although I'm positive the TPTG design pre-dates 1929, I'm afraid I can't point you to the original article or nail down the date better for you. If I get some spare time I'll search my earliest QST CD (All issues up through 1929 IIRC).

Hi Bill,

Don't worry about muddying the waters! I'm very interested in the experiences of other TNT builders.

I elected to go with a 6 turn antenna coupling coil of copper tubing, since I didn't want to complicate my somewhat delicate antenna situation by squeezing in another wire. I already have some overcrowding and interaction. Antique radio is not my only low band interest (Sacrilege! Sorry guys!)

Your grid coil dip at 5.8 mc. is very interesting. If you were reading several days ago you may recall mine dips at 6.6 mc. with the coil such that the set operates around 4.6 mc. If I wind a new grid coil that allows operation at 3.6 mc. it seems likely I will get a dip somewhere around where yours is. I would be very interested in whether you see another dip at around the operating frequency with the dip meter coupled to the grid coil. I do, and that dip is clearly the plate tank. That dip is very sharp.

I just did another test with the set configured as a TPTG, that is with a variable condenser in parallel with the grid coil. With the set tuned at 3.56 mc. I can now ONLY see the plate tank resonance (very sharp) with the dip meter coupled to the grid coil. I cannot find any other dip.

At 170V I can't get any of my three tubes to draw more than 9 ma. I just checked all 3 again and notice they all draw exactly the same current but the Cunninghams have much less RF output than the Sylvania. Maybe they are all duds.

I will keep experimenting. I think my first order of business is to get a better RF indicator. I probably should invest in a known good tube also. I still have a feeling something's not right.

There was been sum talk about plate voltages and '01As. Thought I would run a B+ /output test on one.
I did not alter the GL value. (47K)

UX-201A TNT / Dummy load / Cardwell in series / Ant. coil at 45degrees relative to tank

100V - .25 W
200V - .55
300V - 1.75
400V - 3 and then some.
500V - ? (found it in neighbours yard)

Sig was acceptable to very good depending on plate voltage.

UX-171

Output about the same, but tone was "throaty". ....A bit rough.

Paul, end fed....

Paul, just for info, my grid coil is wound on a 1" dia. solid wooden dowel rod and the coil is about 1 5/16" long. Your coil being on bakelite tubing would probably be a better coil than mine. The grid coil dip is, as Larry previously mentioned, a broad and shallow dip...the GDM having to be close coupled to find it (the tank coil is very sharp, deep, loosely coupled and r/o freq). Seems we are both having trouble getting the dip down below 3.5. I just rechecked and didn't find any other dips...but for some cotton-picking reason the grid coil now dips at 5.35mc???

This is way outside by area of limited knowledge (well, all this really is), but the Windom antenna I use is high imped....around 600 ohms. I don't remember your antenna, but is it a low or high imped. Could the antenna imped. be causing your low plate current? Maybe you could try a 600 ohm dummy load with a series pilot lamp and see what you get.

I use a 6-8 turn coupling coil w/a parallel variable cond. on the Hartley with the Windom and it works fine.

I have no idea how accurate or inaccurate it is but I did compare it on other known good txs I have , even a Transitor one. This rig is clearly far ahead the transisitor one as it barely moves the needle.
I built the rig from Lloyds dimpsydumpster site which I now cant get back on. It isnt perfect. Drifts on keying but I was going to try Lou's trick with the GL resistance. It has 10K now.
I suspect it is working because when I send QRL I usually get a beep beep back immediatly if someone is there. I still think we need a place to operate our vintage rigs. We all have big rigs too. We could meet somewhere on 80 or 40 since some of us have each. We could take turns putting our ancient replicas on air and then get help right then and there. Often it is as it was when some of us were first licensed Sometimes you can pound brass for a week and get no replys even with a good set. I know some of the lads at Regen set up a sked with me on 80 as did Lou a couple of times. It was a big help to me and the reports I got from you fellows too. Otherwise i would think it wasnt working despite the meters. I have had a couple of free contacts too but only a couple. Without a sked and friends to help it can be pretty frustrating.
BTW the TPTG is in the 1948 handbook on page 141 and the plate is 6-2B. Beside that are workable values for all the circuits with some foot notes.

400V on a UX-201A... Lou, you are a wild man! :0)

I just tried to duplicate these results, but cannot. With the ant coil at 45 degrees to the tank coil I get no more than maybe 200 milliwatts out with 320V (as high as I can go). If I set the coupling as tight as it will go without the ant coil and tank coil touching, it will do about 1.2 watts out.

I don't know if my tubes are bad or there is a problem with the rig.

Several key discoveries here today tho... news at 11

400V on a UX-201A... Lou, you are a wild man! :0)

I just tried to duplicate these results, but cannot. With the ant coil at 45 degrees to the tank coil I get no more than maybe 200 milliwatts out with 320V (as high as I can go). If I set the coupling as tight as it will go without the ant coil and tank coil touching, it will do about 1.2 watts out.

I don't know if my tubes are bad or there is a problem with the rig.

Several key discoveries here today tho... news at 11

Hello Don VE3LYX--I hope the members don't mind a new guy weighing in. I think that a timed and set frequency broadcast is a terrific idea. I am working on my license, which I will test for this summer. I would be pleased for the copy practice and the test of my evolutionary station, which is starting with a Hallicrafters Super Defiant (restored) and National Nc-101x (to be restored) and 'future' transmitter a Heathkit DX40 (to be restored and power supply), and straight key, a Wilson RCAF model, and antenna, a wire in the trees.... I am in Sebringville, just north of VE3AWA and would gladly forward confirmation of receiving signals (via e-mail _short term_). Anybody planning to be on the air this Friday evening? Very best/73. Dusty.

2922. An afternoon with the TNT

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-25 22:52:58 UTC
From: N1BUG
Topic: 2922 Message: 2922

Well, well, well...

I was comparing the Federal bayonet socket I had in the TNT with an old beat up Air Gap. Hmm. Post spacing, identical. Mounting hole spacing, identical. Hmm. Height, not identical... but a couple 8-32 hex nuts hastily slipped under each side of the Air Gap as spacers allowed me to slip it right in place with no wiring changes. I wish this socket was in better condition. Ugly. Oh well.

Surprise! This Majestic G-71-A is a half amp version! That required a power supply change, but no problem.

With the Air Gap socket, both the '71A and the '201A will oscillate just fine with the original TNT grid coil!!! These sockets must have a huge difference in capacitance!!! I don't know if tweaking of the grid coil would improve anything or not.

All three of my '201A tubes show identical characteristics as far as plate current, but the Sylvania will put out something in excess of 1W at 320V and tightest possible coupling; the Cunninghams less than 0.5W under same conditions. I don't know what to make of this.

As Lou says, this '71A is also a bit "throaty". Fascinating.

The '71A will produce up to 3 watts out at 300V with tightest possible ant coupling.

Something fishy though. According to my metering, the '71A is running about 50% efficient regardless of coupling. Seems too high, does it not?

My B+ supply has issues with the 71A cranked to anything over 2W. RF getting into the supply apparently. Must work on this problem. Possibly my plate current meter isn't telling the truth for the same reason. Don't know.

I can couple power into some existing (non-80M) antennas but the B+ supply becomes extremely upset, voltage jitter makes the note completely unacceptable. Must find a way to prevent RF from getting into that supply!

Mysteries yet to be solved:

Why such low output from my '201As. Perhaps all 3 are bad?

Why does my rig seem to insist on very tight antenna coupling?

The specification of link angle to plate tank is pretty meaningless unless the load/antenna, and rigs, are identical. As I understand it, the position of the link adjusts the real part of the complex load impedance, and the series condenser is there to tune out the imaginary part.

In reality it's a compromise between the most output and the best note, once everything else (such as grid leak value, feedback tap in a Hartley, etc.) has been optimized. But sometimes you need to revisit these too, and then go back and revisit antenna loading/tuning adjustments.

It sounds to me like your 1.2 watts output is in the ballpark, +/- tube condition, etc.

Lou - thanks for collecting and posting some actual data. I played with the Hartley a bit today and found the 841 likes a lower grid leak value than a low-mu tube (71A, 10, 45), which isn't surprising, since a low-mu tube wants more (-) bias. I have binding posts for the grid leak on the Hartley, so experimenting with grid-leak values is pretty easy. I had ~10Kohm for the '10, the '45 and '71A wanted over 50K, and the 841 is happiest at around 5.5K.

Hi Dusty. I, for one, am very pleased you are weighing in!

Good luck getting the ticket! You'll have a blast. My first AM contact was made using a DX-40 back in (IIRC) 1984. My first CW contacts, earlier, of course, were made using a homebrew rig I adapted from some creation I had salvaged from Roger Adams Laboratory at the University of IL when they were doing some "housecleaning".

Can't be on the air this Friday eve - I have a very unusual commitment. One of the bands I play with occasionally (and I don't mean the ham bands) actually has a gig, and a paying one, at that!

See you on the air, or here until then.

73,
-Larry/NE1S

2929. Re: [AWA Group] An evening with the TNT

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-05-26 01:18:42 UTC
From: N1BUG
Topic: 2922 Message: 2929

So, I made longer leads and moved the power supplies away from the rig, thinking that might keep RF out of it when feeding an antenna. Nope. Made the problem worse.

I then put the 56 ohm resistor load back on the rig. Guess what? With the power supplies further away, now both tubes ('71A and '201A) are "growly" with what appears to be AC on the signal. Good ol' vintage rigs, eh? I will think about this tomorrow.

Overall the rig seems quite stable and solid mechanically (doesn't go completely crazy with a little vibration). Aside from a bit of a growl I think it's ready to go as soon as I get a proper antenna rigged up. Rig is not quite finished yet, so will hold off on pictures until it is. I still need to mount a permanent grid leak and meter.

Lou - thanks for collecting and posting some actual data. I played with the Hartley a bit today and found the 841 likes a lower grid leak value than a low-mu tube (71A, 10, 45), which isn't surprising, since a low-mu tube wants more (-) bias. I have binding posts for the grid leak on the Hartley, so experimenting with grid-leak values is pretty easy. I had ~10Kohm for the '10, the '45 and '71A wanted over 50K, and the 841 is happiest at around 5.5K.

Larry,

Yet in my TNT the above tubes all did quite well with the GL from 27 to 90K. Care to comment? Lou

Difficult to comment, Lou, since "quite well" is not real precise language. But these circuits are pretty tolerant of relatively large variation in grid-leak value, and I certainly don't doubt your results or characterization as such. What I did in the Hartley was substitute a variable resistor for the grid leak resistor and tried to find the best value juggling maximum output, maximum plate efficiency, and stability of the note, for each of the tubes I tried. Generally, maximum output and best efficiency occurred for the same grid leak value, and, as you also had reported, the stability improved on the higher-resistance side of that value.

In my TNT the grid leak I have installed is ~60K (it's a nominal 50K "dog bone" unit that has drifted up in value, or maybe always was 20% high). 50K was the design value for a pair of '45s at 400V, according to the article I followed when it was built. It works with 801A/VT-62s (same characteristics as '10s), as well as the 841s, with this value, but the output/efficiency is pretty poor with these tubes; IIRC around 10% or so. It improves markedly (up to around 30%) when the grid leak value is reduced to around 15-20K. Much lower than that and the stability gets really squirrelly (highly precise, technical term!).

Bill,

I have a 6 turn link coil with a series variable condenser, since I want to use a coax fed low impedance antenna. All my tests so far have been with a 61 ohm resistor, since my 80 meter antenna was severely storm damaged last winter and I'm in the middle of rebuilding the antenna farm. It is supposed to be a 56 ohm resistor, but I measured it last night and it's actually 61. It may be that the low impedance load requires tighter coupling. I'm not sure.

Now that I changed the tube socket the grid coil dip has moved from 6.6 mc down to 4.9 mc. What an incredible difference. I still see no dip at or below 3.5 mc or anywhere else other than at 4.9 mc. I do still see the plate tank dip when I'm coupled to the grid coil.

I'm trying to figure out ways of checking to see if slight changes in the grid circuit resonance would improve operation of the rig, aside from actually changing the number of turns on the coil. It's working with the coil as is, but perhaps it could be better. I would hate to waste wire by removing turns and then find out I need to wind a whole new coil because it was optimized to begin with!

Paul, just for info, my grid coil is wound on a 1" dia. solid wooden dowel rod and the coil is about 1 5/16" long. Your coil being on bakelite tubing would probably be a better coil than mine. The grid coil dip is, as Larry previously mentioned, a broad and shallow dip...the GDM having to be close coupled to find it (the tank coil is very sharp, deep, loosely coupled and r/o freq). Seems we are both having trouble getting the dip down below 3.5. I just rechecked and didn't find any other dips...but for some cotton-picking reason the grid coil now dips at 5.35mc???

This is way outside by area of limited knowledge (well, all this really is), but the Windom antenna I use is high imped....around 600 ohms. I don't remember your antenna, but is it a low or high imped. Could the antenna imped. be causing your low plate current? Maybe you could try a 600 ohm dummy load with a series pilot lamp and see what you get.

I use a 6-8 turn coupling coil w/a parallel variable cond. on the Hartley with the Windom and it works fine.

I was going to try Lou's trick with the GL resistance. It has 10K now.

Don I temporarily installed a 100K, 2 watt potentiometer for a GL resistance. This sure makes it easy to experiment with different values. And the GL R does make a big difference in note quality (chirp, buzz, etc.), efficiency, plate current, etc. I found varying the GL while either key down or sending a string of dits can be very educational. I might recommend putting something like a 5K resistor in series with the potentiometer so you can't accidentally adjust it to zero resistance while doing that. I'm not sure what would happen if you did but instinct suggested one ought to avoid it. I didn't use such a safety resistor myself, but I still think it's a good idea. :-)

Thanks Don, Larry, Mike, and Lou for comments re TPTG.

I did find out there is a two tube version in December 1928 QST (TNX Lou). I suspect there was a single tube version (or several) published earlier but have yet to find out when/where.

My interest in the TPTG arises from my experiments adding a variable condenser across the grid coil in the TNT. Personally I feel it is a much better rig in that configuration. Very easy to adjust for best compromise between note, output, etc. Whereas with the TNT it's really a guessing game as to whether it is optimized or not.It is difficult to see subtle differences when it takes half an hour to modify a coil between tests. I had planned to build a Hartley next but now I'm intrigued with the TPTG and may try that instead. I'm interested in seeing early (20s) TPTG circuits to see what sort of variations existed at the time.

Of course the traditional TPTG uses a high Q grid coil, not the low Q coil of the TNT. That may make it an entirely different beast. On the other hand they obviously knew about low Q coils in 1929 - witness the TNT. So would it be a crime to build a TPTG with a low Q grid coil? As far as I know it wasn't actually done at the time, but it could have been. Hmm.

In a QST poblished when Kruse was still on board he says that, "The guys use hi-c grid ckt.s in their TPTGs, but that is really not necessary." (only slightly paraphrased)

Remember, my TPTG was built after what was a 20 mtr rig. Possibly at that freq that grid ckt was needed. Although mine is a 80 mtr version, I stayed with original grid ckt for two reasons: Appearance (to a point) trumps requirements and hi-c was fast becoming a fetish and wud have been used. Win/win....

My antenna coupling is tight. Three turns at spray paint can diameter. I havent tried the high voltage but with this supply the voltage vsaried wildly. I went through the supply and I had used a resitor , you know the crcuit where you kind of fudge in a resistor when it really want a choke. (which it now has anyway. Bypassing the PS irsitor changed the PS operation completley. it went for swing wildly to less than 5 volts on keydown vrs no load. Anyway your making progress.

Great idea. I spent this morning for an hour or so removeing turn by turn coils from my Grid coil. I remove a turn shoved it through the form and remved the enamel and clipped it. but did not cut it. I eventually removed 14 inches approx (almost 5 turns) Coil was 23 1/2 turns before and is now 17. I may remove one more. I left the rx at the same frequency for the whole ring dang do. 7030. I started of with hardly any rf sniffer light and less than 2 watts on my meter at that frequency. When i finished just now I had at full rf lamp brightness and am almost putting out 5 watts on the meter. (probably 4.8 if I had that kind of meter definition.)
Basically the grid and the tank are now in synch I believe. I have some modualtion on the signal from the PS supply. I will deal with that later. It is from the heaters I think because I added 3000uf to the B+ and it made little difference. I have the heaters on DC from the supply but I think it needs more filtering. I trimmed the excess wire away and retried the grid with just the clip. Still works. Later today I will solder it. I think I am ready for a QSO or will be later today. It really liked the grid coil hair cut.
It is like that with engines too. If you spend time making everything work together you get far more power with less than all the fancy gobbly gook will make.
I am tuned up on 7040 right now and will leave it there. At 4 if all goes well I will give it a shot should anyone have their rx and or rx & tx on.
This whole discussion has been very benifical.

I spent this morning for an hour or so removeing turn by turn coils from my Grid coil.

I've decided to leave mine alone after some checks this morning. My intended operating range is mostly 3.550 to 3.600, though I may venture a bit lower at times. I can get a bit more power if I go lower in frequency, but the chirp gets worse. I can get less chirp but lower power somewhat higher in frequency. Overall I think the best compromise is right about where it is. I believe this chirp/power curve is related to resonance of the grid circuit because if I put a very small capacitance across the coil (pulling it a bit lower in frequency) the whole chirp vs. power curve slides down in frequency.

I removed the last coil loop I referred to in my last post. so I am down to 15 turns. Soldered everything permanent. Power came up. In fact i just blew the RF sniffer bulb. So by playing with the grid coil and nothng else i went from just under two watts on 7040 to above 5 now at the same frequency. I had held off playing with it but finally said to myself. "Self. How long did it take you to wind that coil?" Since the answer was less than 10 minutes I figured right up front if it was a bust I could very quickly at no cost make it like it was again.
So I will gve it a go at 4 PM and see what happens.

I'm going to shut up soon before I wear out my welcome here! But one more thing before I do...

I just discovered the type of resistor used for the GL can have a dramatic affect on signal quality. I'd been using the 100K pot, adjusted to 57K. I replaced it with a vintage 57K resistor and got a very interesting drift to the signal. It steadily moved lower in frequency with keying. I switched back and forth between the pot and fixed R a few times and the result is repeatable. Next I put a modern 56K R in. No drift with that but I could swear the signal has a little more growl to it. This is a very growly rig anyway though.

I'll weigh in here...

I wouldn't recommend running any of the tubes commonly used in the so-called "self-excited" oscillators at zero bias (grid leak R value of 0 ohms). All of these we've discussed - the '10, '45, and '71A - are low-mu(<10) triodes and the tube is "turned-on" hard (no crude comments, please ;-)) with 0 volts on the grid. It will be drawing excessive plate current, possibly damaging the tube. This is even more likely when we push the plate voltage beyond maximum published ratings, as was/is common practice with these rigs. The tubes may not even oscillate under these conditions.

Higher-mu triodes (such as the 841, mu=30) can likely be run safely at zero bias, but will probably be running in more of a "class-B" mode (~180 deg. conduction angle) under these conditions. Better efficiency will be had with some grid-leak bias, although not as much will be required as for one of the low-mu tubes.

As I understand it, oscillator service is similar to class-C amplifier conditions in that the conduction angle wants to be <180 degrees.

Larry -

I know what you meant, but, it is not what you said. Zero ohms on the grid to ground, or zero volts as a consequence, can only be obtained with the grid shorted directly to ground. In which case, of course, nothing exiting would happen. What you meant to say with infinite value of the grid leak, which is what I eluded to in an earlier post, it is possible for bad things to happen, especially if the grid finds a way to become positive. 73 - Mike

Hi Mike!

Actually, I did say exactly what I meant. Paul's question and your response to it related to zero ohms grid leak resistance, which would result in 0V bias, which I had thought, and still think, would probably result in excessive plate current for low-mu triodes. I had not even considered a floating grid situation. If the grid does float positive wrt cathode it would, of course, be even worse.

Larry -

The only way to have zero ohms of grid resistance is to ground it. With it left floating, the grid resistance is infinite. 73 - Mike

Larry, Mike...

I'm not sure if I'm following this correctly.

In a TNT transmitter, one end of the grid coil connects directly to the tube grid, its other end to one end of the grid resistor. The other end of the grid resistor connects to B-. When the key is down, B- is connected to the tube cathode (filament) through just a few ohms (typically 20 to 50 ohms).

If the grid resistor were zero ohms, would that not be darn close to grounding the grid? The grid would be tied directly to B- and be only a few ohms away from cathode potential. My thinking was that this would cause the tube to draw excessive plate current. I am not sure, of course, and don't plan to try it on one of my very, very few tubes.

At recommended plate voltage, it may be that nothing bad would happen. With higher than recommended plate voltage, I'm less sure. These things are capable of drawing a surprising amount of current under certain conditions. One of my CX-301A tubes scared me the other day when the circuit dropped out of oscillation and the plate current pegged a 50 mA meter! Admittedly, I had 320V on it at the time. :-)

73,
Paul N1BUG

Yes, so far so good.

>
> If the grid resistor were zero ohms, would that not be darn close

Yes, for DC, anyway. And that's (I think) what we've been talking about.

> The grid would be tied directly to B-
> and be only a few ohms away from cathode potential. My

Yes, you and are are on the same page and are in complete agreement. There would essentially be 0V on the grid wrt cathode under this condition.

> I am not sure, of course, and don't plan to
> try it on one of my very, very few tubes.
>

I was thinking of doing this for just long enough to get a current reading, and to see of the circuit would still oscillate, and still might. But it's really not necessary. I looked at the plate characteristic curves for a '10, and at 400V on the plate and 0V on the grid, the plate current extrapolates to about 80mA. (This assumes the cathode can supply this current - it probably can. At some point, though, the IV curve will begin to saturate because the cathode will not be able to supply enough electrons.) Anyway, 80 mA at 400V is 32W DC input, and I'll bet you won't produce 10W (probably much, much less) of RF under these conditions, if the tube oscillates at all. That means 32W - 10W = 22W is being dissipated

(turned into heat) in the '10 plate, which exceeds its rated dissipation of 15W . Of course, this scenario wouldn't destroy the tube immediately, especially under a CW duty cycle. But it's not a good idea. If the tube refuses to oscillate, all 32W is dissipated in the plate, and I don't think it would take too long to damage the tube under these conditions.

Tubes are usually pretty forgiving to brief overloads - but since they're not making any more of many of the types we play with, it's best not to tempt fate if one can avoid it!

I am not happy with my TnT I have discovered by testig it has a dirty signal. During a high voltage test 300 B + a monent ago I managed to blow the cathode resitors. Seemed to be smoky in the room then the power fell. .I am going to do a bit of a rebuild . I was measuring plate current looking for the dip which i found. I was searchng on my monitor rx to see hwere it was. I cant get a "beep" so to speak but more a grrrrr on the monitor. I am not satisfied with that. Somewhere I have messed up.
I have been taking a hard look at Ve7Sl web and will go over mine piece by piece to see whereI may have messed up. Got lots of power but it isnt any good.
Meanwhile I may give 80 a shot tonite with the 50L6 rig.

I burned up a filament power supply yesterday. It was a 5 amp variable voltage DC supply I was using to run a half amp filament. Poof! It was old, so guess it was just its time to go.

You may want to be careful with the grid coil. I find the maximum power out and cleanest signal do not occur at the same point. Cleanest signal is some 200 Kc. or so above maximum power output with my 80M TNT. The tone of my signal changes anywhere from what sounds like raw AC (growl) to almost perfect T9 (pure DC sound) which different antennas or loads. Tight or loose coupling seems to make very little difference, but the actual load it is delivering power to does. Not sure why. Good luck with optimizing your rig!

Being general coverage, the tuning rate is too fast for it to be considered a "good CW Rx." Also, the single-crystal filter, basically the same one as in the early HRO sets, isn't as good as more elaborate ones. But that was pretty much standard for the 1930s. That's not to say it can't be used for CW QSOs - I have.

I had the key down too long I think.I found the dip but then was looking for it on my rx to seewhere the grid coil was tuned. . The resistors werre quite small watt wize and just plain overheated. Output is at multiple fequencies almost asif the rig is acting as a mixer rather than an single frw oscillator.
VE7SL has quite a bit about this on his website. ioptimizing grid coil.
What i plan to do is built a simple transistor oscillator with about10 pfs inthe tank circuit that will plug nto the tube socet (2 prongs.) Then i can power the grid coil and find it ony rx with digital read oiut then the plate coil . they should be fairly close. Say within tuneable range . Then i will know what each the coil is as installed. He said he had stated with 23 turns in his 40M gridcoild ona 1 inch form, So did I but it was too much as was his. I can not find anyone who says I eventually wound up with it optimized at 19 turns for instance. Right now i am trying to find a matched pair of resistors somwhere between 50 and 100 ohms. I watt or better. Then maybe i will just redo the test. I had it on300 volts when it opped. I have a 150 volt supply too so maybe should use it for optimizing. Power when it pooped was huge. No one would belive ot so i wont bother mentioning the figure on the meter but isuspect some of that is because the signal is so dirty.
Don VE3LYX
Ill willl try just off optimimum to see how it works.
Don VE3LYX

Gonna a try a quick CQ on the rockbound rig before turning in (3555).

Subject: RE: [AWA Group] Re: 40M TNT - Don

Larry is indeed right in all he said below. My only comment was that if you obtain zero voltage on the grid by essentially shorting out the grid leak resistor, at the grid, to ground, nothing will happen from an RF output point of view, as any RF at the grid will also be shorted to ground. No RF feedback can occur. I probably misunderstood where this variable potentiometer was being placed. The attached pdf article shows typical characteristic curves of various tubes, including the lower mu 210 for DC conditions. As can be seen in one of the graphs at the end of the article, the 210 will be dissipating about 20 watts at 300 volts on the plate and zero grid voltage. However, there will be no RF output. If the bias is obtained through an RF choke or the cold end of a coil, then that is a different story as the grid will not be grounded from an RF perspective. In that case there may be some RF output, but hardly worth it, HI. 73 - Mike

I'll weigh in here...

I wouldn't recommend running any of the tubes commonly used in the so-called "self-excited" oscillators at zero bias (grid leak R value of 0 ohms). All of these we've discussed - the '10, '45, and '71A - are low-mu(<10) triodes and the tube is "turned-on" hard (no crude comments, please ;-)) with 0 volts on the grid. It will be drawing excessive plate current, possibly damaging the tube. This is even more likely when we push the plate voltage beyond maximum published ratings, as was/is common practice with these rigs. The tubes may not even oscillate under these conditions.

Higher-mu triodes (such as the 841, mu=30) can likely be run safely at zero bias, but will probably be running in more of a "class-B" mode (~180 deg. conduction angle) under these conditions. Better efficiency will be had with some grid-leak bias, although not as much will be required as for one of the low-mu tubes.

As I understand it, oscillator service is similar to class-C amplifier conditions in that the conduction angle wants to be <180 degrees.

Larry is indeed right in all he said below. My only comment was that if you obtain zero voltage on the grid by essentially shorting out the grid leak resistor, at the grid, to ground, nothing will happen from an RF output point of view, as any RF at the grid will also be shorted to ground. No RF feedback can occur.

Mike,

Now I understand what you were saying, and I totally agree.

My concern was what would happen to the DC plate current with zero volts on the grid (grid shorted to ground) and plate voltage substantially above the tube recommended maximum. Some of us are abusing tubes with higher than rated plate voltage. I was concerned about excessive current possibly harming the filament under those conditions. It may well be these tubes can handle such conditions for a brief time without damage. I'm not sure, hence my original recommendation that one avoid letting grid voltage go to zero while using higher than rated plate voltage - just to play it safe.

Thanks for the article link! That is a keeper!

I'm totally bummed. Now that I'm flat broke, '10 tubes are going for reasonable prices!

On the up side, there are at least two lessons to be learned from this, and I'll be sure to absorb both.

There's a currently-active thread on the Glowbugs list discussing the possibility of creative substitutions for tubes such as the '10, '45, etc. I did some work this morning trying a triode-connected 1619 as a sub for a '45, and made the post below. I thought some on this list might be interested.

73,
-Larry/NE1S

---------- Original Message ----------
Subject: Re: [Glowbugs] Work-Arounds for expensive triodes?
From: ne1s@...

To: tetrode@...

This morning I poked around my tube boxes a bit more and found that pair of 1619s I knew I had.

I made an adaptor - octal socket to four-prong plug, to see how a triode-connected 1619, which is basically a 6L6 with a directly-heated 2.5V cathode, would work as a sub for a '45. I wired the beam-forming plates to pin 7 (one side of the filament), and plate to screen through a 1 Kohm resistor to limit the screen current (although this is probably unnecessary and could be replaced with a direct connection). Also, of course, pins 1, 2, 3, and 4 of the 4-prong plug go to pins 2, 3, 5, and 7 of the octal socket. First I tested the 1619 as a 1619 - it was a strong tube with Gm of 4000 vs. a minimum acceptable value of 3400. Then I tested the adapted triode-connected tube as a '45. Gm was quite low, only about 150 (yes, 150) vs. a minimum acceptable value of 1850. This is probably because biased as a '45, the triode-connected 1619 is near cutoff: tube manual lists bias as -20V for the 6L6 in the triode connection, vs. -50V for the '45, both in class A operation and with 250V anode voltage.

Undaunted, I then tried the adapted 1619 as a substitute for the single-ended AF output '45 in my Radiola 66. It worked fine, with no noticeable reduction in volume or distortion increase compared to the '45. There was a barely-perceptible increase in hum, and I suspect this could be eliminated by creating a virtual center-tap for the filament with a pair of series resistors, and connecting the beam-forming plates (pin 8) to their junction. I also suspect the reason it worked well was because the Radiola 66 employs cathode self-bias for the '45, and this allowed the triode 1619 to self-adjust its operating point closer to the correct place. It may not work as well in an application where fixed bias is used. I wanted to see how a pair would work in some sets using a pair of PP '45s, but discovered one of the two 1619s had an open filament. I'll have

to find some more.

I'm pretty sure this sub would work fine in a old-time LC oscillator transmitter circuit such as a Hartley, TPTG, TNT, etc., but of course would not be "legal" for the AWA 1929 Bruce Kelley QSO party. Re-optimization of grid leak resistor value may or may not be required.

Topic: 2991 Message: 2991

I always use a battery for A supply with my regens. They are far more effective on battery power. Today while at CTC (Canadians know) I found some rechargable 100000 candle power flashlights on sale for $14 . I bought 2 and tore them apart to discover a nice 5 volt gel batery inside, a charge controller and a switch. They also come with a wall charger and and an adapter for charging from a cigar lighter in a car.
I have one hooked up to my UX201 regen right now. When darkeness falls I will put it to work and see if it can go longer then I need it.
BTW I will be on 3555 tonite at 9:30 PM for anyone interested.

I have run the regen 2 hours and 35 minutes with no loss of sihnal. heater still glowing strong. That is enuf for practical use for me. I would consider the battery a success. I have two so far which gives me a cushion and the abilty torun more than one tube.I may add two more. I would like to power my TNT heaters by battery too.
Speaking of the TNT I reworked the plate coil last nite. I will redo thegrid coil perhaps today. I am waiting for my resistors for the cathode network. I have thousands of resistors but almost none under 1000 ohms. I have 10 2w 68 ohms coming.
Speraking of the regen , the singe tube one. i ran it last night on the loop I made from a Dollar store hola hoop. It needs double the turns I have but it does work just the same. My other regen the 6SL7 also runs a loop. a 12 inch one and it is moe than adequate. Loop antennas really really settle down a regen from a tricky little devil to a very good working radio. It also eliminates TVI completley.
Speaking of rx es . The one radio news I have has a circuit in it called a unidyne. It uses only a 6 volt battery and dual grid tubes. Says no loss in volume and very hi quality audio. There is a schamtic for a three tube with the third tube optional but text describes a one tue and a two tube as well and the photo is a two tube. I have some 58 tubes here or maybe they are 78s I forget but I know they are tetrodes . Might be fun someday to do it. Says it is a "gulp" british circuit but if it works what the 'hay.

Sounds similar to the "Hiker's Special", which uses a single type '49 and
the filament battery for B+. I think that one was an Aussie design, but
could be wrong.

Nothing wrong with Brit radios. Lucas automotive electrics, on the other
hand... ;-)

I know it's bad form to reply to my own post, but I have an update to report on the stuff below.

I tried connecting the beam-forming plates of the 1619 to the screen grid. Specifically, the screen and beam forming plates are tied together, and connected to the 1Kohm current-limiting resistor whose other end is tied to the plate. Same results as below testing that arrangement as a '45 on the tube tester. Then I tried it again in the Radiola 66 in place of the '45 AF output. Same results, except that the barely-perceptible increase in hum was gone, as the beam-forming plates no longer have 1/2 the AC filament voltage applied to them.

Still in the Radiola, I made some DC voltage measurements wrt one side of the 1619 filament:

Plate volts: 257
Screen/b.f. plate volts: 255
Grid volts: -21

This agrees, for all practical purposes, with the stated operating conditions for a triode-connected 6L6 in the RCA tube manual (RC-14). So the DC negative feedback provided by the 1500 ohm cathode self-bias resistor in the Radiola 66 did indeed allow the triode-connected 1619 to find its "Happy Place."

I'm now going to build up 2 "permanent" 45->1619 adaptors. A friend of mine has some 1619s and he has kindly offered to share a few with me. This will allow me to keep the old sets around here going should I lose a '45 - all I have are in radios; no spares left - and free up a pair should I want to use them in the TNT.

BTW, Brad, I did try re-soldering the filament pins on that dead 1619 - no joy.

I have had a Truimph 1971 Bonneville since 1976 , it has all Lucas electrics , THE ONLY problems I have EVER had with it was of my OWN doing , I really think they are getting a bad RAP!!! I also have a 1957 Truimph Thunderbird that was a Dirt track racer , IT also has Lucas Electrics ,VERY nice MAG also no Probs with IT !!! I think alot of the problems with LUCAS Electrics in auto APPs, were prob. the result of owners who thought the cold improve it , OR just plain , not paying enough attention when they were working on it : (

Any problems were usually pretty universal. Wiring in many cars was very similar (even RR to Jag). So diagnosis became almost automatic. Anyway. We are a bit off course maybe.
The HF bands are not that great this week. I just checked 20M about an hour ago. Not much happpening. Anyone doing vintage AM? I am looking for a very simple circuit. Maybe screen grid mod or something. Not more than three tubes .

> Don VE3LYX

Yep, vintage AM done here. It's gonna be hard to do it right with 3 tubes, but it can be done. You are probably going to have to use a carbon microphone and associated transformer to keep the tube count down. Here are a few topologies that come to mind:

1) MOPA with screen modulator. You may be able to get enough output from the secondary of the mike transformer to just wire that secondary in series with the screen supply. If so, this is only 2 tubes. If there's not enough poop there, use a tube screen modulator and drive the modulator grid with the carbon mike/tranny. See the old handbooks for appropriate screen modulator circuits. Set the DC screen voltage on the final for about 20% the maximum available RF power output, to allow for positive peaks with asymmetrical modulation.

2) MOPA with Heising plate modulation. in this case the modulator grid would be fed from the carbon microphone/transformer combo. If you would allow push-pull class AB modulation (which requires a 4th tube but no more complexity) it would probably be less critical to design and use. The Harvey-Wells TBS-50 used a carbon microphone/transformer directly driving the grids of PP 6L6s, which modulated an class C 807 PA.

3) Plate-modulate a crystal or Hartley oscillator transmitter directly. It's tricky, and can be hard to get a legal (in this country) signal, but it can be done. If you want to a acheive a high modulation percentage you'll have to use high-level negative peak limiting with a keep-alive supply, but I'm getting beyond the scope of my intended response.

Thanks for the reply Larry,
I have been looking at this circuit.
http://electronbunker.sasktelwebsite.net/OneTubeXMTR.html
Not because it is a ham tx which itis isnt here but could be but because it has a beam power final. I have a good working tx here with a 50L6 which produces a decent signal and suffcient power for me. I was thinking about building a version of this with my circuit and 50L6 but like this moving the other triode parts to a 6SL7. .

Dear va3awa,

It came out of a large collection in FL and was part of an early amateur station display [and labeled as a rectifier] .. The lack of corrosion on top or around it would seem to argue against it being a battery which would have used acid as an electrolyte. A rectifier used a borax solution electrolyte with metal electrodes, zinc and/or aluminum. I would assume they are replaceable but have not disassembled one to confirm. I didn't want to take the chance of breaking the top connector to try and unscrew the top.

Hi Don,

I believe it came out in the late 30's, & was succeeded by the 811A shortly thereafter...

Hello Lou, Others,
I think the Taylor T55 first appeared on the scene in 1936. I may be off a year plus-minus, but it's right around that time.

The T55 was a outstanding success that resulted in tubes like the T40 and T20, etc being very popular as well, but the T55 came first in the series.

I think the very first Taylor tube was a 866 late in 1934? that was a lot more cost effective than a RCA, GE, etc.

Ha! Way to go Don. You remind me of a local fellow I helped put up some antennas some years back. He had a summer cottage on a lake just outside of town. We were stringing a dipole between two tall pine trees when a branch on a tree half way between got in the way. I didn't climb in those days and the branch was higher than even a 40 foot extension ladder would reach... even if we could get a ladder up through lower branches. Sam said it's no problem, I'll be right back. He went in the cottage and emerged with a 10 gauge and ONE shell. I thought boy either he only has one shell on hand or he has a lot of confidence. Did I mention he was well into his 80s at the time? So Sam put the shell in, raised the gun, aimed for like half a second and BLAM! No more offending branch. I made a mental note... whatever Sam says, he's right. :)

By the way, Sam also had a vintage rig he'd built in the early 30s. It was some years ago and I only saw the rig a couple times, but if I had to guess today I'd figure it for a TPTG. I distinctly remember two large coils of 1/4" copper tube at either end of the rig. That was the one and only "real" such rig I've ever seen. I wish I knew where it ended up. I would hope his family might have kept it, but since none of them were hams, the chances of that probably aren't great. I learned after the fact a local club had been asked by the family to help dispose of Sam's ham gear, and though I don't know for sure I have an awful gnawing feeling in my gut that thing might have been thought to be junk and... horrors... discarded! It's probably just as well I DON'T know for sure! I can only take so much trauma!

I cannot lie. Later this afternoon whle I was repairing the winch wiring in the back of my truck so i could whinch my dragster in an OPP Chevy SUV puled in the end of the one driveway. He sat there for awhile . My wife was planting Morning Glories around the mail box and I was clearly visable working in the back of the truck. I would imagine he was responding to a "Shots fired" call by a concerned neighbour but I am duley licensed and I do live on a small hobbby farm. He never got out. Just sat there for awhile and then left. Guns are stored as per the law and are all registered and I am certified so ??????

Yup.
Contrary to rumours to the opposite Canadians are allowed to have guns and many do.
The difference is our guns are only for hunting or target shooting and are never under any circumstances to be confused with being for self protection. Just not a concept we have here.
Anyway all antennas are working well now!
I have my dc battery supply almost done.I will have any mutiple of 12 volts to 120 Volts plus 4v & 8v to boot. Should cover about anything I will need for RXs and even my 40 TX will run on 120. Both my tx and rx have heater rheos so 8 will do nicely for the 5 volt supply. I can charge the whole deal I think with a current limiting device (Aka light bulb) a diode and a house hold plugin cord. That is the plan anyway.

This is a concept -I- don't understand. Are not innocent lives, including your own, worth protecting, and with the use of deadly force if necessary?

Police, while necessary, are not sufficient - they cannot be everywhere at once, and almost always arrive on the scene after the crime is committed.

I'm the most peace-loving, non-threatening person you'd ever want to meet, but if someone was trying to inflict harm on me or my family and capable thereof, I would not hesitate to use deadly force. Being in such a situation is my next-to-worst nightmare. My worst nightmare is to be in such a situation and not have the tools to defend myself or my loved ones.

Off topic, I know, but I didn't start the discussion.

I just tried the triode-connected 1619 as a substitute for a '45 in my 40M Hartley. It worked, as in it oscillated and sounded OK in the monitor receiver. The power output was low and the plate efficiency was horrible, around 1W out for 12W in. But I didn't do any optimization of the feedback tap or grid leak - I'll leave that as an exercise for the reader ;-)

I'm really living on the edge now - I responded to my own post which responded to my own post.

73,

From my trip to Germany This is the radio room in the Sinsheim Techniks Museum . There was probably over a hundred units on display not all here. I took pictures of lots of them. Both German and US and Allied . This museum is beyond belief for technically minded people. Anything from a Concorde jet on the roof to the Blue Flame Land Speed record holding car from the 60s. The radio room apears to be under development. Already it has a lot on dislay.
When the Germans do a technical museum they dont fool around.
There was also a display of electric cars BTW the day I was there starting with ione made in 1900 you could have a ride in to many that drove in off the road for the day.

From my trip to Germany This is the radio room in the Sinsheim Techniks Museum . There was probably over a hundred units on display not all here. I took pictures of lots of them. Both German and US and Allied . This museum is beyond belief for technically minded people. Anything from a Concorde jet on the roof to the Blue Flame Land Speed record holding car from the 60s. The radio room apears to be under development. Already it has a lot on dislay.
When the Germans do a technical museum they dont fool around.
There was also a display of electric cars BTW the day I was there starting with ione made in 1900 you could have a ride in to many that drove in off the road for the day.

Over the past week I have completed a small project, satisfying nonetheless.

Now that I have the Hartley going well with an 841 (sort of a high-mu '10) in the socket, I wanted to try plate-modulating it for AM. The first order of business was to move it from 40M to 75M, since QRP AM seems to be more effective on 75M up this way. I bought 10' of #6 bare copper ground wire at the hardware store, as it was about the same diameter, and about half the cost, as 3/16" copper tubing. I wound 13 turns, 3" diameter, and replaced the 40M coil in the Hartley. It fired right up, and easily tuned to 3885 Kc/s.

Next, I dug out a small Kenyon modulation transformer that Tim, WA1HLR, had given me a while back. It had been through the fire, but was still serviceable. (His original place was lost to a brush fire many years ago). I built up the ever-popular 3-diode negative peak-limiting/keep alive circuit, which is great for directly modulating oscillators because you can set the keep-alive voltage so that the oscillator doesn't quit on negative peaks, and still have good positive peaks for communications effectiveness. For a speech amp/modulator I used an amp I had built in college, and improved upon since that time, which uses a 24A mike amp (for a high-Z xtal microphone), '27 intermediate audio, '27 phase inverter, into PP 45s. The 45's drive the mod xfmr.

After correcting a few snafus and making some adjustments which were completed this morning (it's cool and rainy here today = good WX for radio work), the monitor 'scope showed I was modulating a the carrier, and it sounded pretty decent on my local receiver. KA2QFX, K1REC, and WA1SSJ were holding forth on 3885, so I broke in with my mighty 4W carrier from the modulated Hartley (yes, 4000 mW of raw power!). Conditions weren't great, but they heard me well enough to carry on a conversation. There were some stations farther away that couldn't hear me well.

I'm sure that I'll have a lot of fun with this set-up this fall when band conditions improve. I'll be on with it tomorrow morning with the group on 3870.

Larry & Group -

This really is great. I can confirm that low power AM QSOs are a lot of fun and can do wonders with a decent antenna. While not as old as the equipment Larry used, and, also commercially made, I also had a lot of fun with low power AM on 160 and 75. Over 20 years ago I was on 160 with a bunch of guys with my T-368F running 400W of AM carrier. I then switched to a Wireless set 19, running on its dynamotor, and putting out about 2 watts of AM carrier and tried it. Some could hear me and a few could not. Low and behold, about a week later I get a packet from an SWL in Wisconsin, who was listening to the whole roundtable, and, also taping it. He sent me a cassette of the whole thing. Indeed that was neat. I still have the cassette and both rigs. This was when I lived in Manassas, VA. I was using an inverted L antenna, running up my 60 foot tower and then out about another 80 feet or so.

Since I have moved to NJ, I have also been on 75 AM with a pre WWII designed BC-474, a TCS, of course the WS-19, and, the lowest power of them all, a shipboard Sailor radio, transistorized with about 1 watt of output using internal D cells. I sure hope I can get my basement back in order in the near future and start having some fun again. Sure do miss it.

I am making progress, and my storage facility I just rented is almost full. Of, course, all of the stuff in there came from upstairs. So, no progress in the basement yet.

I am now able to get into my family room, so, I took the attached photo from one of the skylights in there. This shows my 70 foot tower, which only supports my inverted V. My inverted V is 145 feet of #6 solid copper on each side for a total of 290 feet. It is fed by homemade ladder line with 6" spacing. It goes to a monstrous homemade tuner on the inside of my Bilco door to the basement. Use it on all bands with great success. Have fun guys - 73 - Mike

FB, Mike,

I'm especially jealous of your antenna - as you say, I'm sure it works great from 160M all the way up through the HF spectrum. I'm not sure we ever talked on AM, although I've been active on that mode for about 25 years. I know you and I have talked previously on the 40M SSB AWA net, and perhaps on the "Sunday PM AM net," many years back

I was on 3870 this morning as promised, and had good luck being heard by all stations but one, who had a high local noise level. A bit later I went up the band to 3885 and ran into Tim (HLR) and Alan (KA1ZZC), who were both also running plate-modulated Hartleys at the 50-100W level. Since mine had been engineered for stability over plate efficiency, mine as the "tamest" of the bunch
(.... . .), but also the weakest.

One idea I had for more power from the plate-modulated Hartley is to finish of a breadboard grid-driven amp that was under construction by John Rollins, W1FPZ, before he passed away. Tim W1GIG had given me the project from the estate. I'd bias it up for linear operation, of course, and it'd give me about 50W out. I may have to bump that one up higher in the project list. John was going to use a 250TH, but in keeping with the 1929 theme, I'd probably use a 211.

So what would be the bare minimum for an Am transmitter circuit? I have seen several designs using a 6sa7 or its minature equivalent for an Am low power transmitter. They were crystal controlled in some instances. Osc and modulator in the same tube(pentgrd conv). With a PA attached and maybe a driver tube if necesary could a practical Am tube tx for say 80M be made? Is there some reason why these circiuts are not practical for upscaling. I would like an Am cabailty ideally for my 50L6 rig but to build a speech amp , a modulator and wind up with one tube in the tx and 3 or 4 in the audio seems wrong to me. Not that it is it just seems to me so. I keep wondering if I can screen modulate my current rig. Anyway it is a very interesting subject. Sorry to interupt. I am absorbing as much as possible. I am old enuf to believe that Ham means H-AM.
Tis how I got interested before Donald Duck came on the scene.I am very anxious to hear Ne's set on air.

Hi Don,

A very minimalist set-up for AM fone (with a bit of wobbulating FM thrown in the picture, too, no doubt!) would be a stand alone oscillator-transmitter, coupled to a Heising modulator.

If you belong to the AWA, you will recall that Bob Raide (W2ZM) published an article in "The OTB" on just a set-up several years ago. His design was QRO, with 203A / 211 tubes, & the exciter was NOT xtal-controlled, either! I worked Bob on 40 fone one time with him using that set-up, & as long as he didn't push things excessively in the audio gain dept., his signal sounded amazingly good.

This has NOTHING to do with radios. It is an automotive oscillascope for testing ignition patterns (primary and secondary), charging patterns and injector waveforms. Most likely made by PAL equipment of Kalamazoo.
How Do I know? I used to demo them here in Ontario for Hastings Corporation. (Nice job too $47 per hour from when I left till i got home on thier fuel too which 25 years ago was very nice!).
I have its twin still here in my Garage.
Where would anyone think this was radio?

Hi Steve,

Where specifically does it say in the regulations that it's illegal to modulate an oscillator...?

I've heard more modern rigs from the 50's & 60's on AM that "wobbulate" far worse than W2ZM's set-up!

The only generic reference that I've ever seen in the Canadian rules & regulations is the statement that frequency stability---as a whole / in general---is to approach that of crystal control...and I'm not even sure now where, exactly, I saw that (if, in fact, I even did!).

I've hardly got the US Part 97 rules committed to memory, let alone the Canadian ones!

But, it's my understanding for a while the US rules explicitly banned modulated oscillators below some frequency. Then they re-wrote the rules focusing on specifying the characteristics of the signal, and not how it was generated. So, if it is "done right" it is theoretically possible, at least, to have a legal modulated oscillator. I've heard Bob's rig on 160M many years ago, and as Eddy says, it's very stable with no detectable FM. From what I can tell monitoring my own plate-modulated Hartley on 80M that's also the case. Whether it meets the letter of the law or not, I honestly can't say, but I don't think it violates the spirit of it.

73,

Hi Eddy - I don't have the Regs in front of me so can't give you an official rule number. I do recall seeing the official rule for the US published in a late 30's QST that specifically mentioned 'modulated-oscillators' no longer being permitted below 30mc. I'm sure Canada followed-suite as they usually did when it came to cleaning-up the bands. As well, the term is somewhat dated now I think and the official wording may be closer to what you have stated....still pretty much the same situation though as I can't imagine a modulated-oscillator approaching xtal control...come to think of it, even the Rollins Rocket doesn't do that ;-)

So who wrote the current rules? I dont know that but in the 80s when the Xmers(CBers) were freed from licensing requiremnt the guy who recommended that on his review of the Canadian Radio Licensing act for DOC was one Harry B Dulmage P Eng.MBA. Seems to me I know him. He is my father.
I shall ask him next time I talk to him. One thing I do know is he would not make such a rule himself. He was radio design engineer. (Whoops is. he is still breathing.) and did not limit hiself with what might be possible. Just not his style. It will be interesting to see what he says. he is still quite sharp on radio questions.
First job was making FM practical for mobile and communications use. next were the radios for the Avro Arrow and the Voodoo "gas can" radio. Then he was Chief Engineer for Pye Canada for awhile and then went into consulting. It was during his consulting business he rewrote the radio licensing act and the interconnect act for DOC.
It will be interesting to hear what he says about modulating osc. He will probably disown me (AGAIN!)but will tell me how to do it I am betting.

Hi Steve et al,

Here's the specific lowdown of the Industry Canada rules & regs re. frequency stability:

****

12. Amplitude Modulation and Frequency Stability

12.1 An amateur station transmitting amplitude modulation is limited to 100 per cent modulation.

12.2 The frequency stability of an amateur station in a frequency band below 148.000 MHz shall be equal to or greater than that which is obtainable using crystal control.

****

Nothing specifically banning modulated oscillators therein at all, Steve.

For even more details on our regs, go to:

http://www.ic.gc.ca/eic/site/smt-gst.nsf/eng/h_sf01709.html

Hi Don,

Yes, most interesting, indeed...

Not to be critical of the way the FCC handles Ham radio matters, but I've detected a definite slant, or bias, in the past decade, or more, favouring the business side of frequency allocation therein, with the placement of Ham concerns being relegated to the back burner. This was especially evident during the tenure of the now-departed Powell Jr. It seemed like most everything was made available to business interests---for the right price.

I got my eyes opened here in Canada some decades ago, when I had a conversation with a then mover & shaker with the old CRRL, who had an extensive on-going relationship with the then Department of Communications. In essence, he said, we Canadian Amateurs could pretty much do as we pleased on the air---so long as nobody complained vociferously about what we were doing.

In truth, he said, we Canadians enjoyed a sort of a "laissez faire" relationship with the powers-that-be. I think that pragmatic approach gave rise to less mandatory regulation from on-high, & the application of more common sense from the galley below...

I think I am going to try a rework of this circuit.
http://electronbunker.sasktelwebsite.net/OneTubeXMTR.html
A 6SL7 for osc and audio amp driving and midulating a 50L6.
Proven circuit, Crystal control (at least for now) and decent power . I have both tubes in my 1930s station. A 6SL7 in the regen and a 50L6 in the 80M TX so i have already power supplies for both, am familair with both tubes and I have new unused spares of both. I think I will keep the plate circuit the sameas on my 50L6 tx since it is easy to make and works well. I will move the rock to the onesecton of a 6SL7 and use the other half of that tube for audio. Not unlike m,y regen . One side osc , one side audio. With a carbon mike and a transformer /'battery circuit I should be able to drive it hard enuf I think but time will tell.That will eliminate any iffyness in Freq control . Now where are my octal sockets?

A good philosophy of governance in general, methinks.

I think this is pretty much the status quo concerning the FCC and amateur radio in this country, as well. Occasionally there is petitioning of the FCC by some "special interest" within the amateur community for some restriction that gives their favorite ham activity some advantage to the detriment of others, and the rest of us need to initiate a letter-writing campaign to defeat it.

Go for it, Don!

Best bands for QRP AM operation are 160M, 75M, and, to a lesser extent
(IMHO) 40M, all in the winter months when D-layer absorption is minimal
and QRN is low.

Also 10M on those rare occasions when the band is open.

I think to a large extent this is still the case. In reality, I believe that amateur radio is just a large pain-in-the-butt to IC as, like most everywhere else, they are snowed-under with commercial work and likely understaffed. A few years ago when RAC and IC worked together to create the 2200m experimental licencing program, it was indeed a very laissez faire relationship and we were permitted to run the experimental licences within the amateur radio service when technically it should have been within the commercial experimental service. They were quite willing to let us do our thing as long as we reported our results regularly and didn't disturb the Naval comms down there. When the Conservative government started to run things there was big push for grreater accountability regarding funding and rule-compliancy...doing things 'by-the-book'. When we next tried to impliment a 500 kHz (600m) experimental program based on the highly successful 2200m outcomes, IC would have nothing to do with it within the amateur radio service and it was a 'take it or leave it' commercial service program that was proffered to RAC. No amateur radio call letters could be used and no communications with stations in the amateur service...ie. no 'cross-band' QSO's would be permitted with hams...basically a licence to mindlessly 'beacon' only. As well, amateurs were required to pay $40 per year for this 'privilege' ! I think RAC set a very dangerous precedent when they wilted and accepted this terrible idea as it really has nothing to do with real amateur radio....and it was an exact duplicate of what the FCC was offering their amateurs. Not much independent thought there.

Although not directly related to our discussion of modulated-oscillators, it does demonstrate some recent changes in IC's attitude regarding the rules but as mentioned earlier, I really don't think they have the time, will or staff to be overly concerned with what we actually do on the air....within the amateur radio service.

Now, whose got an NOS 813 they don't want.....that Tri-tet circuit should modulate nicely with a big Bliley!

Steve

We went with friends (son of silent key of VE3NN) to Ottawa today. On the way up Hwy 15 we stopped at Bernies Nearly New Shoppe. I found three pop electronics of 1958 variety there. One has a two tube shortwave receiver build. Switchable band changing (hartely as a regen)Low and behold a double triode and a beam power tube.
the double triode I could use a 6SL7 (GG Rf amp and regen detector) in double triode and a simple AF amp using a beam power tube. (I could use a 50L6 there.) So going further i would have a 6SL7 in the reciever with a 50L6 af amp and in the Tx a 6sl7 with a 50l6 modulated PA as well. That would need a filment voltage of 112 (I am in a rural low voltage area) This would allow my favourite PS circuit. Regen was using a hartley style coil setup. (tapped rather than seperate tickler winding)Might be a good RX/tx build for my old radio cabinet. Rx on the left and Tx on the right. That TX circuit in the am rig is a colpitts style i think and can be comverted very easily to VFO from Xtal . In fact some of Frank Jones old circuits give the option either way. Parts count could be reduced by sharing Af amp and Af transformer but savings would be so small why bother and it may complicate an otherwise straight forward project. I am going to draw up the parts list for both. I'll see what i have on hand. Most all of it I am thinking. I may junk the multi band function and build it as a 80M rig period. Although it would be posssible to do 80 and 40 easily.

Hi Don,

you probably realize the 50L6 takes 0.15A for the heater, and the 6SL7 takes 0.3A. So if you're going to series 'em all up, you'll need to shunt the two series 50L6 heaters with a 667 ohm 30W resistor (2X power safety factor) that will burn up just as much power as the two 50L6 heaters to get the correct voltages on all the heaters.

I think it'd be better to use a pair of 12SL7s (0.15A heaters just like the 50L6s) and let the voltage on the heaters be a bit low- I don't think they'll care. Or use a pair of 12SL7s, a 35L6, and a 50L6 (109V total for the string).

I hadnt gotten that far but sound advice. Thank you. I was doing my parts list for the tx just now. 12SL7 is a good compromise for sure. There would be nothing wrong either with a 35L6 50L6 grouping. In fact i would be surprised if I dont have a 35L6 "in stock"
I could also do the 12at7 or 12ax7 etc group but they just dont look right!

FB, Don.

If you don't have any 12SL7s, I just checked www.tubesandmore.com, and
they have them for $5.75 US each. If you search around some you could
probably get them for less.

I'm with you - miniatures are just too modern and don't have as much
"soul!" Octals or (preferably) earlier all the way...

It wasnt bad here. I heard someone start to send but never got past the CQ CQ CQ DE----------and then went silent. It was a pretty decent signal. There was a warbbler in there for a few minutes as well.
Some one AA34J it semed but didnt make sense to me was pounding brass at high speed. I sent a sieres of Vs (V V V de VE3LYX VE3LYX K) with an I D so you could find me. Stayed at it til 20 to 10. Oh Well maybe next time.

From: geo
Topic: 3112 Message: 3112

Hi

I had some success on QRP operation so I decided to see what I could cobble together out of some 1920s tubes and whatever parts I could scare up and make something to run DSB SC on 20m, QRP.

I posted the photos in my folder "VE3GZB".

It's still a work in progress but the basics are up and running. Power supply is salvaged from Heathkit stuff as are most of the variable caps.

The tubes, all battery operated types, need 2.0V on the filaments. Here I had to cheat and I ended up putting some solid stage voltage regs at each tube. These things aren't sold at your corner radio shack any more so there's no sense in leaving the filament power unregulated.

I still need to add audio circuitry, still need to put finishing touches on the oscillator to enable fine tuning and to isolate it from hand effects. But the balanced modulator works just fine.

Just thought I'd share,
73s geo VE3GZB

I am back tuned up on 3561. Late tonite I am going to give it a whirl.
I spotted it with my spotter osc so all should be right on. Probably between 9 and 10 but I do not have an exact time due to other home activities. If you have a working rig feel free to join me should you hear me. I will be receiving on my regen as usual.
Starting tomoorow i have to get to work on my display for next weekend of antique ham stations (1920s and 1930s) I will be operating from the Ameliasburgh Museum daytime 10 to 4 sat and sun. if you are near ie Rochester NY(about 35 miles) or within striking distance for daytime propagation please give it a whirl. I will be amplifiying headphone output from the regen so patrons can hear. I will be writing a short handout on the history of radio both local and national as well as North America. I dont fear bad propagation, I dont fear lack of public interest. What I worry about the most is a lack of particiapation from my fellow hams.(local club is a closed shop or so it seems) I will stay i believe tuned up on 3561. I have to make an antenna for the site. Thave given me a barn to operate from. I will try to make the antenna as close to my own inverted L i use on 80 here since it seems to work well. I will have my old vibroplex on display and will be doing some morse demos (spell your name in morse code always seems to go well. Some of the audio stuff will not be vintage but will be hidden anyway. Everything in view will be vintage or vintage style recreations. If it draws enuf intrest we will be applying for a museum specific call. If you are near and feel like coming come ahead , introduce yourself and join in the display. I have no idea how it will go butI want to give it a shot to make historic radio part of our history where it should be.

Mostly S5-7 with some QSB, Q5 except for occasional deep fade.

I am attaching some pictures of the components of the plate-modulated Hartley. You wouldn't see much if I had taken them in-place. Hope the reflector doesn't choke on the ~2MB of images. Lou, you've seen the Hartley before. The only things "new" are the Bradley variable resistor for the grid leak, Pilot ceter-tapped filament resistor, and the 841 tube. Only photo I didn't take was of the Hartley power supply.

73,

>make something to run DSB SC on 20m, QRP.

George - a most-interesting approach and one which is rather unique for sure. Please keep the group posted on your progress. With such a design it would be possible to sneak-up on the unsuspecting SSB crowd and they would never know that you weren't on SSB!

Like you, I find those old $10 Heathkits at the fleamarkets a treaure-trove of useful vintage components once I get over the horror of having to strip them.

I have also found the use of solid state regulator chips for the filaments a great solution...the addtitional filtering they provide pretty much guarantees that the fialments will never be a source of unwanted hum.

Will you be building an 80m version?

Does anyone else have a project on the go? It would be a great to keep the list-traffic active with your building progress and share some of your findings. I always find these reports inspirational. I will soon be posting some results from my present project...a version of the 1946 QST "Longfeller" ...I'm calling it the "10-20 Longfeller"

From: Don
Topic: 3121 Message: 3121

Some of you will remember our discussion of regs and osc modulating a week or so ago. I said I would ask "the old boy" at next oppourtunity and today being fathers day i spoke to him for a long time on the phone. This is what he said when I asked him that question)osc mdulating legal?)He said it would be very hard to say specifically. The radio regs accumulated over many years were very complicated and sometimes at crossed purposes with regs being added with little thought about previous rules. He said when he did his review and it was a partial review he worked with council (lawyer) for the DOC. This fellow told him that in fact the reg were so intertwined and mixed that it would be virtually impossible to prosecute someone based on them which is why they began then at least to start to simplify themm. Dad said based on what he knew then and after working with this fellow you would have to do something pretty stupid and dangerous to others to find youself in hot water. So i asked " So if you kept a low profile and were careful not to cause others interference you could probably do just about anything reasonable and not get in trouble?" Dad said "I think that would be correct" in his P Eng speak. Now he is 87 but still pretty sharp so i would take it as that being true.

Yes I think that is very much the case nowadays Don as IC simply doesn't have the time or resources to monitor or act on most amateur radio related happenings. I suspect they would like to see us just go away or even be turned over to RAC to administer (shudder at the thought). Short of calling CQ on the local police dispatch or Pearson tower ATC, we are pretty much left alone by IC.

Hi Don,

In essence, that's pretty much how my old friend in the then-CRRL summed-up things vis-a-vis Amateurs & the DOC...

When you think of---not TOO hard, either!---the main (the only...?) Industry Canada rule that's on the books about a transmitter's frequency having to be, by law, "...as good as, or better than, crystal control," would surely earn most, if not ALL, Canadian participants in the annual Bruce Kelley 1929 QSO Party a slap on the wrist from on-high...

...That's why I maintain that it's perhaps best not to think of such things too, TOO hard! Hi Hi.

And even with that I monitored my TNT when testing and although it wiggled a bit it is in reality very very small. I know what 1 KC is on my dial and it is not even in the slightest that much. Basically if with rx on freq you dont lose the hetrodyne or note it is very small. We are on CW which is narrower that Am or perhaps even SSB. Mostly just carrier with no sidebands . so even if there is a slight warble it is still a very narrow bandwidth. A bit of AC on the note gives one a bit bettter chance of being heard but it would be better without it. I am hoping today to get my all Battery supply up and running for both rx and tx.
Malsehen (time will tell) Don VE3LYX
BTW Listened in on the 3885 AM net last night for awhile. Spurred me forwward in my build I beleive. I used my Kenwood big rig's rx zero beated to hear with wide open filter. It wasnt perfect but not bad. Tonite I may try with the regen and may record some .

Hi

It wouldn't be hard to make this to run on 80m, in fact it would probably be a lot easier I think!

But the largest antenna I have is cut for 40m anyway, and all of my QRP has been on my 20m dipole, which is high enough now to be effective on QRP.

I'll share progress on it here, thanks and 73s

I usually fire up the rig bfore bedtime for a few minutes (my 80M 50L6 tx) 80 was open last night and there was a net of some sort running on my freq. Even though I QRLed twice I got no response but was promptly run over. I never heard them there before but noise was very low and signals strong. I am working on my display everyday these week for the weekend deal at the museum.

I just finished wiring my gel battery pack. I have 122 volts, 61 volts 48 volts 12.3 volts 8.2 volts and 4.1 volts available just by picking the proper combo of leads. I need the thumbscrew posts and i need to make a period correct plywood lid but I do now have pure Dc available easily. Now I have to see if can I charge them up safely from household line with a diode and a light bulb in the circuit for protection and current limiting. I think it will work because of the RMS thing and going from Ac to Dc It is not too big or heavy and as soon as I get the posts with the thumbscrews mounted I will show ya'all. Cost so far about $130. Everything new.

Don,

Are you planning to leave these in series when charging them? Has anyone done this? What happens if you have one (or more) bad gel cells. Does the total charging voltage get divided evenly across the remaining good cells (and possibly over charging/destroying them)?

I dont know for sure Niel but I will soon. When we charge a normal 12 volt battery there are 6 cells of 2.2 volts in series and that works fine. I could build a voltage divider netwrok even with 1 meg resitstors since the rules of electricity are constant however i think it will work as is. I have a 100 foot extension cord and a big yard for the test. We could figure and calculate and postulate or I can just plug it in and see. A famous engine designer once said "1 good experiment beats 1000 expert opinions." I have learned that this is a good axiom (providing one is not careless when testing.)A 100 watt bulb in series should limit curent flow till i am satisfied it will work. It will also work as a charge indicator to some extent. That may be too much resistance but I have lots of options. I will let you know how it turns out. Should have it charging in the morning.

The long lead standing up is the 48 volt suppy. The others are at the end and are as I mentioned. The hack saw blade lying on the upper row of 12V gel batteries give an idea of size. Not really that big. The other pic is the low voltage section made up of three 4 volts .

I bought the binding posts today and installed them. I wired up a quick charger. 1 diode in a power cord. I set the unit in the garage with the door open and powered it up . Voltage came up from 123 to just a hair under 150. That is just over +2 for each 12 volt section which is good for charging. Charge current is not high. i know because the single diode doesnt get hot. i measured each indiviual section. Voltage varied from just over 12 to just under BUT... remember these batteries other than one here have never been charged and I had checked them when I brought them home to see. There was a lot of difference in "at rest" volts. So I left it on charge and will for an hour with the voltmeter connected then I will recheck. My concerns about too much charging current proved unfounded.
So far so good.

From: Don
Topic: 3133 Message: 3133

After an hour of charging at rest voltage rose to 140 v. An extra 1/2 hour made no difference. I dont know about Gel batteries but car battries and charging i do know. That should be in fact 138 volts with a more accurate VM and some of that is surface charge. A decent load should in a few minutes bring that down to 132 and it should stay between 120v and 132v in operation withocccasional charging. If I get time tomorrow i will hook up a 100 watt light bulb to it and see how long it sustains normal brightness. Anyway i have a workable PS with no hum producing circuits and it should have good life and staying power. Cost is reasonable and it s totally portable. I will wire the charger in "either or". Either charging or battery power but not both at the same time. There should be no need.

After 2 hours and 1 min I got tired of testing. Voltage under load from the bulb was never over 120 and never under 116 (just a hair past 115. After switching off after 2 hours and 1 minute within a minute and a half voltage had recovered to just over 120V and was slowy climbing. Tis at rest recovery with no outside influence. So is the Ps good? It will run a 100 watt input transmitter key down for 2 hours and 1 minute and still maintain good voltage. I think it will be fine for any of my glowbug transmitters and receivers. .
I am stamping it "approved" here. .

Today I installed an 80M inverted L antenna at the museum in preparation for tomorrow and Sunday when I will be hosting a vintage ham radio station at the museum in the equipment barn. I will have my 1920s station on display and my 1930s ststion tuned up on 3561 in operation. I will be calling CQ at 11 Am and 3 PM (EST) for sure. I have prerpared a handout for the public . I have no udea how this will fly but Ameliasburgh Museum Curator Janice Hubbs has made the space available and given the green light. This weekend is also the Quinte Flywheels weekend at the park so among the ht and mis engines and 100 plus antique tractors there will be some dit and dahs. In case the band is dead as it isnt the best time of the year I have tapped quite a bit of CW and will stash the odern tale plaer out of sight but use it so the public can at least hear how it sounds. I tapped my 50L6 unit calling CQ as well so it is authentic just the same.
I have no idea how it will go but I am trying. If you want to give it a try for a QSO QRO moderen or otherwise or QRP glowbug whatever all will be welcome call -ins. I will be signing VE3LYX P .

Maybe I did pick the right weekend after all! At least there will be on air activity. I will still give it a shot at 3 Lou. Am on my way in a few minutes to finish set up and get ready. Will take pics too. If I get newspaper interviewed and I often did when I did my fiddle making display there I willl be sure to mention this group.
Tis a big event at a big museum. Accross the path from me is a 500HP Goldie Corliss Steam engine.There will be 100 plus antique tractors, A sap shanty, a black smith, a wheel right, soap making , a couple of hundred hit and miss engine sneezing and popping ,old cars (including my 426 Max Wedge 63 Dodge) all that and food too! I am taking ham to eat in my ham station. Schwarzwaldeschenken for those who know what that is. Schmeckt gut!

Bill,

From my experience, the 202s modern equal would be the VT-25. My TNT is set up for 210/10s. One night I exchanged the '10 with a 202. There was no difference in output or signal quality. Luck?

Hey Lou,

Yep, no doubt substitutions can be made, but I'm wondering if there is a progression of tube numbers for the 202 (or what ever the 'five watter' might have been back then)...exact same tube, but just in a diff. envelope, or longer pins, military version, etc...like the history of the '01A and 210.

GM Lou,

I did a little 'googleing' and found this on the 202/210:

" Development of the UV-210 began in 1922, and it first came into use in 1924 as a replacement for the UV-202 . The UV-210 was superceded by the UX-210 in 1925." Info from the:

Looks like the 202 wasn't around too long.

Looks like the 202 wasn't around too long.

And GM to you, Bill.

That's settled then.

BTW, in the QSTs of that period there are numerous mentions of 5-watter rigs all having 202s.

What's the interest in 202s? Another rig project in the works?

I was just wondering if I was missing other versions of the 202 that would be 'legal' in the '29 Party. So it looks like the '5 watter' turned into the '10 which is still pricey. Yep, those 5 watters were used a lot...but alas, no more around I guess, except for the '10 version.

As far as a project..ummm, maybe yes but probably no ...I've been wanting something that I could replicate from farther back than 1929. Have been looking in the 1924 QSTs and see several possibilities. One in particular is the 3 & 4 coil Meissner. There are a couple of good articles about the 4 coil version, also a MOPA plus a few regen articles...so just thinking and pondering. I may go back thru the '29 Party logs and see who was using a Meissner and maybe contact them and see what they used for a guide.

Bill

□

Looks like the 202 wasn't around too long.

And GM to you, Bill.

That's settled then.

BTW, in the QSTs of that period there are numerous mentions of 5-watter rigs all having 202s.

What's the interest in 202s? Another rig project in the works?

Hi Bill,

The 202 is the tube for earlier rigs for sure. They do come up on eBay for between $150 & 200. Not suggesting going into debt, but doable for most. A paper route comes to mind...

I was just wondering if I was missing other versions of the 202 that would be 'legal' in the '29 Party. So it looks like the '5 watter' turned into the '10 which is still pricey. Yep, those 5 watters were used a lot...but alas, no more around I guess, except for the '10 version.

As far as a project..ummm, maybe yes but probably no...I've been wanting something that I could replicate from farther back than 1929. Have been looking in the 1924 QSTs and see several possibilities. One in particular is the 3 & 4 coil Meissner. There are a couple of good articles about the 4 coil version, also a MOPA plus a few regen articles...so just thinking and pondering. I may go back thru the '29 Party logs and see who was using a Meissner and maybe contact them and see what they used for a guide.

I dont have 40 M tx capabilty at the museum 80 was to me dead as a doornail so I plugged in my 40M coil rx so folks could hear something. I have another 80 M coil for the rx. it has higher regen (different tickler for short loop antenna connection which I use at the museum. I will take it toorrow. The one I had has had the tickler design modifid to lower gain with a longer lead in from the loop. It would perfect in the shack where the loop is several feet away but at the mueum it is right at the back of the RX, This rx BTW is super sensitive and you are constantly dealing with that in mobile ops. . It never fails to amaze me what it can hear. So tomorrow will be only 80M again.

I probably just missed you as I had someone jawing with me(which is why I was there so i had to deal with it. When I turned back to the rig and turned it on there was someone there but by the time the tx tubes warmed up I heard nothing after that . I checked from time to time all day but that was the only 80M signal I heard. People seemed more interested in talking than actual operation. If I am asked to go again I think I wil just do a static display. It was interesting some folks were very interested and others not at all. I do a fiddle making display at the same museum sometimes. usually labour day.I would say I had more visitors for the radios than I do for the fiddles. Maybe 15 to 20% more. Anyway Thanks for trying. I am now about 3 days behind on home stuff so i got to get cracking today.Still was a fun weekend. May have a visit fro the discovery chanel today as they are in the area. The producer phoned last week and said he was sure but be prepared if they decide to do a deeal on vacuum tube radios while they are on the area. I did some work for him years ago when he was working for "another network"

Hi

With the DSB SC rig I'm trying to build using vintage 1920s Cossor tubes, all 2 volt battery types, I'm just not getting enough power output (I calculate it to be under 10 milliwatts at this writing, far too low).

I think it's because my RF drive levels to the power amplifier are not sufficient (or are being loaded down to become insufficient).

I'm using a master Hartley oscillator triode, coupled loosely to a screen grid buffer tube (like the '22), and the output of this screen grid tube is used to isolate the oscillator (which it does extremely well) AND drive the pair of push-pull finals (audio pentodes) which are neutralized.

The master oscillator is very well isolated. I can listen to it's beat note in my Kenwood TS830S and the drift is well under 100Hz on the 20m band.

The master oscillator is almost entirely enclosed in copper box and it's voltage is regulated.

If the screen grid buffer could only output more power, I think it would be much better output drive to the push pull finals. I don't have any such well screened power tubes though.

The only tubes I have which could push power all require neutralization and I don't want to deal with trying to neutralize a buffer while trying to make the master oscillator as stable as possible.

Are there any vintage schematics/ideas which old timers figured out and which may be still useful today towards improving RF drive power levels yet still maintaining a high degree of buffering?

Thanks and 73s

I read some of my old books last night and decided to do some changes.

The tetrode buffer stage will remain because it does such a fantastic job of isolating the master oscillator from any load changes. But for more Oomph I must add a neutralized power amplifier Triode after it, using fixed tuning.

From this additional power amplifier I will then feed the push pull finals.

It's a lot of changes to be made, I hope it will work well!

Gentlemen,
I have attached a JPEG of a "1930 type" PA stage. I would still like to get an eyeball
on Rollins' 860 final. I may have overdone the shielding. The right angle drives are used to
get the PA tuning to the same position as the present 830B PA I use. What can't be seen
is the grid tank. I link couple from the 802 buffer/doubler.

The plan is to use about 2KV on the plate of 860 at roughly 100 mils.

Hi Mike,
I totally agree. The "Buck Rogers" configuration of the glass envelope is inspiring. After reading several articles re: the shielding, needed to avoid neutralization, I built this configuration. I don't think the expanded metal would be cricket for '29 or even '34 (the basic origin of the TX). Ross Hull did write a QST article using one as a MOPA. He using copper sheet and a sub-panel to shield the grid and plate.

I made several attempts to get pix or a look at Rollins' 860 PA stage but was greated with silence. I gave up.

Thank you for the kind words.

Topic: 3167 Message: 3167

When I popped the resitor network (Cathode) while doing some long key down testing I disovered I had no non-K resistors left in my junk box. Since I live in an electronic desert I ordered a ten pac and waited. A couple of weeks ago I installed them , 1 watters this time just in case.
Yesterday after a wonderful morning in the park at Trenton with my friends (yes both of them!) and our vintage cars I came home and decided it was time to complete the original test. I was suspicious the grid coil and the tank were not singing the same happy song. With my Dummy load (an 11 watt light bulb) I had realized full power at bout 6.3 Mhz. I had been chasing this down before as I had figured my full tune was happenng where I didnt need it. This morning I finished and removed a full additional 2 turns from the grid coil(one turn test, remove another test etc) . Now I am at full brightness on 7050 and it sounds clean. A transfer to the antenna changed tuning little and a very slight adjustment of the tank brought it on freq. Power on my through meter is a full 2 watts. I am on my battery power deal I made a couple of weeks ago. I have the 4.1 volt feeding the heater of the UX245 through a 20 ohm reo and about 130 Volts on the plate. I feed the ground to one side of the heater and the 4.1 to the other side. I let the resistor network in the cathode /heater supply provided the voltage for the rest rather then feed that network direct. (because i am using from a single battery pack and I have a common ground for both 4.1 and my hi B +). I thought it might work and it did with no dicernable difference from an indepndant heater supply and a seperate cathode connection. Heater supply lasts much longer now(in fact havent pooped it out since this change.) If time is good I will give it a whirl tonite on 7051 at 8 PM my time. (Ontario)
Later today I will finalize my solder joint for the grid coil and charge my battery pack for a bit. I am going to check input power now to see what I am burning from my battery pack.

I am good to go. All connections finished. Battery deal charged. Through meter shows 3+ watts under load. I can find it with the kenwood. Has a bit of a whoop to it so I need to do the GRdlk tricks . Still i am going to give it a shot tonite. On or about 7050 but that is approx as hand capacity is a bit of an issue.
8 pm my time. Both units are on battery. Regen is running happily on 67 volts and sharing the 4.1 volt heater supply. Switiching is on common ground circuit. Battery seem to have no issues with this set up.

□

Does anyone know what size the 1920s annunciator wire was...maybe #16 or #18? It was used quite a bit for coils..Thanks, Bill K4JYS

Don,

Just checked the (very old when I got it) "bell wire" I used on my 1972 wired TNT. From this and observations over the years, I would say #18 or 20 with #20 favoured.

73, Lou

From: geo
Topic: 3177 Message: 3177

I'm not having any luck getting much RF power out from these ancient Cossors. Their LF and DC gain is ok, but at 14 MHz they don't give much...the absolute most I've gotten seems to be under 50 milliwatts but more typically about 10 milliwatts is what I'm able to measure on the output.

My goal is 1 to 5 watts maximum at 14 MHz.

So now I'm considering using a pair of 47s as push-pull finals. Would they be any good at 14 MHz?

If not, please recommend a tube?

Thanks and 73s

47s may work fine, but you may also want to consider a 46 - it was commonly used as a class B amplifier with both grids tied together. I seem to remember this will be a DSBSC set, right? If so, will the balanced modulator be the final stage, with parallel RF feed to the control grids, and PP audio to the screens? Either way, I think either 46s or 47s would work. also 59s.

73,
-Larry/NE1S (whose been having a great time on 75M with the 841 Hartley plate-modulated with a pair of PP 45s. Was able to maintain a mostly Q-5 QSO into the Schenectady NY area from my Gray, ME QTH this morning).

U am now into my AM rig build. I did all the chassis drilling today and drilled holes for tube sockets screws as well. Sockets were rescued from an old radio. Final tube count is two 50L6s and two 12SL7s
One odd pair for the reciever and one for the TX. My original circuit uses a colpitts style xtal osc but I may make the osc a normal Hartley as is the Regen circuit's basic design. I intend on using my recent purchase the Military push button mic. It is supposed to be a carbon mic which is what I need. I would like it both 40 and 80M but that is not finalized yet.

That's right, it's to be a DSBSC transmitter for 20m.

Ok, if the 47s will give reasonable performance then I'll start to take the current transmitter apart and redo things for a pair of 47s and the filament power they'll need.

I was just giving it a whirl now. Somewhere just above 7050. On my moitor reciever it has quitea whoop whoop. Doesnt alway sound the same though froma nearby rx as a couple of hundred miles away. I switcback to my Ac powered PS as the UX45 tubes eats up my 4 volt supply at a ferocius rate.
So I am thinking about the whoop in my signal. Sounds like Donald Duck. I am wondering too big a grid leak (too much flowing out?) Or am I thinking about it backwards?

I am tuned up just under 7100. I am as low as 7092 and as high as 7099. Somewhere in the middle of that if I can find an opeing. I am sending everytime I am in the house all day long. Tx has a distinct quacking sound so shouldnt be hard to find. Output is very strong (or so it seems to me.) Kenwood can hearit with no antenna hooked up, just a couple of inches of hookup wire stuck in the open coax connector. It is bending the needle on the DX160s S meter even with reduced gain. It is as I said now on AC PS (ac filiment and Dc B + with much filtering .) Still I am sure there is a hum on the signal. My battery supply works but having the heaters voltage coming of at the end of the chain was a dumb idea for the UX245 tube. It can kill it in ten minutes if you are busy sending. I will make a stand alone heater battery supply to go with this deal and try that sometime.

slow osc (click-click-click-click-) is coming from the Ac powered PS. I will try reversing the plug on the in power. If not then the hunt begins. I am, as I said, tuned up on 14.020. Note is better sounding there according to my montor RXes . Power is down but still a good 1 3/4 watts. I will be out tonite but will try it anyway at 6 6.30 and 9.30 if I am home by then. I shuld be almost bang on. It behaves much better up here. I have an idea how to easlily make it 40 and 20. I will have to put the wire back on the grid coil but will centre tap it and use a Clip to decide 40 or 20M
Don VE3LYX

I am all ears.
Signal sound clean , slight hum (PS hum) tunes sharpely
Power on the meter is down but signal sound good.to me. muc better than lower. Tonite i popped a heater control reo. I have a HD substitute that will fit and should put an end to that problem. Checked thw tube but the base is coming loose. What is the best glue for regluing.

well Don...simply put, there is no logical reason why it should sound and work better on 20m than it does on 40m unless something is terribly wrong on 40. These TNTs and TPTG rigs behave poorer and poorer, especially signal stability and quality, as you progress in frequency.

Steve

PS...just don't use CA on the tube base as any heat from the tube could cause some unhealthy fumes from the glue.

I am not opposed to the ideaI I didnt have it sweet on 40. I noticed brfore when I had my glasses on I had a wire touching the second loop of the tank coil plate side. I wondered if I tuned the grid and fixed that would it tune up on 20. It tuned up with about 30% cap still engaged (appox 110 to 120 MMFD) I figured it sould be ok so I hooked it up to my 20M vertical and checked with a couple of receivers . everything was working fine. Signal was clear strong steady , did not move . Donald Duck had disappeared. Now if I can get it to sound that clean on 40M I will be happy but I am going to leave the 20 M connection and put a clip on the grid line. so I can choose the band. I figure rightly on wrongly that 40M should be about 2/3s engagement or 240 MMFD on the same tank circuit plate side. I will still have some extra should I need it. Time will tell.

Thanks for that, Lou.

When I need to completely remove and re-install a tube base, I clean out the old cement and use in its place the black high-temp silicone the auto stores sell for gaskets, It too holds but remains pliable so thermal expansion mismatch is a non-issue. I have also used this material with success for re-glueing grid and plate caps, including plate caps on power-dissipating tubes such as the 812 and 866.

Just this week a base fell off what I thought was a display-only UX-201A with no filament continuity. I had previously tried re-soldering the heater pins with no success. After the base came off I saw the leads all had a layer of blue corrosion (probably oxides of copper). Cleaned 'em up with sandpaper and the heater now showed continuity. Then I tinned all the leads and re-installed the base per above. Tube now lights and tests good in the I-177 Gm tester. Another UX-201A saved!

If you can't or don't need to remove the base - It's a PIA for higher pin-count tubes - something with a lower-viscosity than the silicone would work better, so that it can wick into the joint where it's needed. Does that describe the Locktite product, Lou?

I'm going with a triode oscillator and a 6AG7 buffer now, pushing a pair of 47s in DSBSC.

Do you think the type 47 pentode will run at 14 Mhz without neutralization?

Good question. Use a good layout (gazouta at opposite end from gazinta) and hope for the best!

Too bad you couldn't keep the 2.5V pre-octal theme going. The 6AG7 is a great tube, but you may be able to accomplish the task with a 2A5, 59, 46, or another 47, to keep it in period.

Thinking along the sugggested line and dipping back into my 40 plus years fixing cars for a living I went and bought some Loctite 840 (No, not 480, 840) This is Loctitie rear view mirrow adhesive. It is what holds your mirror on you windshield.I took a tube and tried it. You have a cleaneractivator supplied wih it and unless you tube is completley separated you cant get it in thereso i wiped as close and possible with the supplied wet wipe hoping it would run a bit into place. I then applied the adhesive 840 loctite liberablly around the tube base. I held it together and counted to 240 or something like that. Voila ! a complete cure , invisable too. I tried thetube now about 10 times in and out of the twist socket both cold and "ow ow ouch" hot. Looks original.No black goo.
A mirrow is seemingly overloaded on a front window and gets super hot on a sunny day and survives for years, sometimes forever. I figured it would also work here. It does.
on another front Ihave been working on my tnt. I replacedthe Rs reo for heater voltage with a Cole Hersey dash light dome light dimmer switch. It works fine and doesnt care about the load from a tube. Now that I have god control I went downstairs and found my supply of 45 tubes. One was lazy so I foced it into osclilation a coule of time KEY Down trigger filmentand b plus off and on a coule of times when it lit I left the key down for about a half a minute. it works fine now. BUT the other 45 glows purple when it oscillates. I just love it! A multi coloured glowbug was beyond my wildest dreams. I have heater glowing reddish orange, arfindicator bulb the glows when all is well and now a tube flashing out the morse code with a purple glow. SOme days are real good. This was one.

Hello Don,
From your description of the infamous "purple" glow, I would say
the tube is suffering from the dreaded "Chili" effect (aka GAS). Almost
all surplus 807s had it. I've used them as long as the purple is on
envelope and not down in the tube elements but it is a dicey deal.

Be careful of the 46, it had grid emission problems. This lead to creeping plate current in some applications.

If the purple glow is between the elements, it's probably gas,

If it's on the surface of the glass envelope, it usually indicates the
opposite - a nice hard vacuum, allowing stray electrons to strike the glass
at high energy (i.e., without losing energy from collisions with stray gas
molecules), creating fluorescence.

I am embaressed to say what was wrong but I will take my shame in the hopes it may help someone else. I had snuck the 45s heaters up to 3 volts. They were still not bright so I figured it could take it.
Tube output doessmarten up ncely with a bit more heater and i have lots of spares so I did it. I plyed withthe heatervoltagecontrol only to discover it had a direct effect on the clicking or self oscillation beginning.I backed it off till the clicking stopped. Clean MMM. So unfair . Power is down too. I am running it on low voltage B+ so I could use my doubler supply if I need more. I will leave it as is till i get a signal report.

For a parasitic suppressor, you want the resistor to be 10s of ohms, not
meghoms!I Using a one megohm resistor is just like placing a small inductor
in series with the plate (or grid) lead, which is not what you want because
it can actually encourage VHF parasitics. Use a 22 or 47 ohm resistor
instead.

I'm not sure I'd blame a parasitic on too much filament voltage. That may
increase the gain of the tube a bit, and encourage an oscillation if you
have a marginal situation already. More importantly, I can unfortunately
attest from experience that too much filament voltage on a 45, even with no
plate voltage, will kill the emission of the oxide coating on the filament
long before the filament opens up. Be careful out there!!!

OK. I dont have any that low. Best I can do is a 68 ohm. It will have to do. I follow the theory though. Couldnt find a book with an example so I choose a 1 meg. I will change it out today. Thanks. Now that you say it that way it makes sense. I also hope to rework the Grid coil so i can get back down to 40M as well with a clip lead from the tubes grid .

Attachments: 2 described; binary payloads are missing from this source WARC

My son Alex (age 26) is becoming interested in electronics, and since he's one class (physical chemistry lab) away from a dual BS in chemistry and biology, he does have a good foundation in physics. A while back I was delighted that he asked if I could suggest a construction project he could build, or we could build together.

I happened to be perusing my Gernsback collection, and found a simple VHF oscillator in the July 1940 issue of Radio News, and I thought that might make a good starter project: not too ambitious, and something that we could put together quickly.

Yesterday afternoon we both had some time, so we did it. Still need to make a pretty finished breadboard, mount the oscillator to it, and terminate the filament and DC power supply connections in Fahnstock clips, but we were anxious to try it out so we clip-leaded the electrically-complete unit to a power supply and it fired right up. The tube you see is a ST-style 841, with 150V plate supply. I tried several other tubes, adjusting the bias resistor and filament supply voltage accordingly: a VT-52 (801), VT25A, 45, 26, and 01A. I was able to get it to work well with all but the 45, which refused to oscillate. Strange, because that was one of the tubes used in the original article. (He also mentioned success with a 01A and 26. I bet if I play with it some more I could get a 45 to work - the 2 I tried were probably a bit on the weak side.) According to my frequency counter the oscillation frequency was ~110 MHz, about right since the article said it would be around 3 meters wavelength, depending on the tube parasitic capacitances and the size of the single-loop tank coil.

I got that done and redid the grid coil for both 20 and 40 but it reallly doesnt ned the 20 winding as it picks up 20 anyway just like an old style two band single xstal tx. I also changed the keying circuit a bit and now key the B-. That completley does away with my worries of volunteer oscilations.
Re 45 tubes . I am developinga real hate for these tubes. No two are alike and they will only oscilate if heater voltage is at least right on or slightly high. A 01 for instance will work from about just under 4 to almost 6 vlts and never give a whimper. a 71A is also good and is probably my personal favourite. Tank circuit tunes both 20 and forty with ease and might even do 80 siince I have still about 50% C avaialable at 7040. 20m (14020) comes with about 10% C engaged. A triband single control TNT Transmitter? Ah life is good. I have a 80M grid coil so I may try it this week.

Since frequency is inversely proportional to the square root of C for a fixed L, your circuit will not work on 80 as you only have about twice as much capacity available than what you need for 40 meters. You would need four times as much capacity for the same L to make it work on 80. Besides, it sounds like your C to L ratio is to high anyway. It would be better if you could have a different L for each band, with a smaller C, to minimize tuning and repeatability requirements as well as mechanical interactions, hence stability in both frequency and output power. Regarding the other oscillations you are seeing, at this point I do not know why you should. Those tubes did not have a very high frequency gain characteristic, so, parasitic suppression was seldom used back then. Regardless, to minimize it, as Larry said, you need to kill those with a very low Q small L in the plate circuit, hence the small value resistor to wind a small inductor on. Sometimes nichrome wire could also be used but it is more difficult to connect to. 73 - Mike

I have renamed them glass turds
When the have a heater problem they pop one side open and become 5 volt tubes . If you push that they die. At anything less than 2.5 they wont oscillate in my circuit. I have one good one left. If I run into any i will let you know.

Thanks!

I've had pretty good luck with them, in audio applications, as well as in the PP TNT. I had a great pair in the TNT that just chugged away for years, until I inadvertently gave them 7.5 volts on the filaments which killed their emission.

From: Samuel Beverage <smlbvrg@...>
Subject: OFFERS TO AWA MEMBER
Date: Wednesday, June 29, 2011, 7:03 PM

Dear OM; June 29, 2011

In the AWA Review Volume 23 I saw pictures and read about the restoration of some large Black Dial Zenith which reminded me that I have one of approx that era. It has been in unheated storage for quite a number of years and I would like to offer it to anyone who is willing to come and get it.

I will attach two pictures. I don't know the model no and I don't know it's condition but it appears to be all there

In addition I would ask whomever might be interested enough to come, that they also take a very large and heavy General Radio Variac, condition unknown. For whomever might take up on my offers I would also include a GE 20 AC Ammeter which is known to be in good condition.

I ask that all three items be taken.

Now the catch is that I am located on an Island in mid-Penobscot Bay, east of Rockland, ME. The ferry normally makes three round trips a day but to assure getting on and off a reservation is usually needed and one would have to get the first one leaving Rockland in the morning about 9:30 AM and if lucky leave on the middle one about 12:30. There is very little turn-around time between the middle one leaving Rockland about 2:15 PM and leaving here about 3:30 PM, so it would be important to get the first one from Rockland and have two chances to leave. I am 3 miles up island from the Ferry Terminal.

So if you know someone who might be interested I would appreciate it if you would send this offer in the right direction.

The cabinet is 42 inches high, so a Van or a SUV of that clearance would be needed.

I am offering these items Gratis but if anyone happens to have a manual, or at least a schematic, of a Drake R4B Receiver I need one.

73,

Samuel H. Beverage, W1MGP

Apparently I shouldnt have mentioned RCA. My 87 year old Paw phoned today (P Eng etc etc) I ran it by him. He gave it a "certainly possible, have seen stranger things" but said i should not have said "ask RCA"
>I wont tell the rest of what he said but I am still smiling. Didnt now "the old boy" had such strong opinions!
Anyway. Tnt is working great. (from all measurments.) Would like to get some on air experience with it but will probably have to wait till the snow. Meanwhile I have the 80M 50L6 rig hooked back up and running. So now I am good on 80, 40 and 20 with homebrew single tube rigs. On to the AM project!

As a general rule...ballpark estimate...etc, how much more power would you get out of two 1920s receiving tubes run in parallel...such as the 201As. With the extra wiring, socket, tube, etc...is it worth messing with? Are there any particular problems that crop up when running two tubes as an oscillator? Also, since both will be used in an oscillator circuit, such as Hartley, Meissner, TNT, etc, how close should the two tubes be matched and what parameters should be used in matching? Thanks...

Theoretically, two tubes in parallel will give you exactly twice the poer as a single tube. Same plate voltage, same plate efficiency as a single tube, but twice the plate current. If an amplifier stage requiring power to the grid circuit (i.e., other than Class A or AB1), you'll also need twice the driving power.

> With the extra wiring, socket, tube, etc...is it worth messing
> with?

6dB more. In a marginal situation, this could make or break a successful QSO.

> Are there any particular problems that crop up when running two
> tubes as an oscillator?

Keep lead lengths short between the two tubes, you want to avoid making a push-pull VHF oscillator (remember my recent post, I was able to coax a 01A to oscillate at 110 MHz!).

> Also, since both will be used in an oscillator
> circuit, such as Hartley, Meissner, TNT, etc, how close should the two

If you have a tube tester that tests Gm or emission, I would start there. I have a Tek 575 curve tracer I've used to actually get the plate curves, and if I wanted to really chose the best match from a stash of a particular tube type I'd try to match the curves as closely as possible. But that's probably not necessary. You can also test them in circuit after you've wired it up by measuring plate current, grid current, grid voltage independently for each tube. You can also pull one tube at a time, retune as needed, and see if you get approximately the same RF power output from each tube. As far as quantifying "how close is close enough," I don't know. If the final product works to your satisfaction, declare success and move on ;-)

BTW I always had similar thoughts about push pull or parallel
tube circuits.(Yes i know not exactly the same butfor the sake of the discussion)though i may build one just to see. Course you could use a 19 or a similar dual triode in those circuits and then any concern over match would be pointless because you wouldnt be able to change it anyway which imedialtely leads one to wonder how closely matched are the triodes in a dual triode tube?

Don, if you haven't found them, there are a couple of good articles on the Meissner osc (3 & 4 coil versions) in the May and Jul 1924 QST. Also, Mike, WU2D, had an interesting article in the 2009 AWA Review....Bill

Thanks Larry for the explanation and to Steve for the adjustment to the gain fig. It may be worth a try, even for the 'lil ole '01A. It 'sounds' powerful just to say "two tubes in parallel"...ought to be worth a db or so in the sig. rpt...hi.

Theoretically, two tubes in parallel will give you exactly twice the poer as a single tube. Same plate voltage, same plate efficiency as a single tube, but twice the plate current. If an amplifier stage requiring power to the grid circuit (i.e., other than Class A or AB1), you'll also need twice the driving power.

> With the extra wiring, socket, tube, etc...is it worth messing
> with?

6dB more. In a marginal situation, this could make or break a successful QSO.

> Are there any particular problems that crop up when running two
> tubes as an oscillator?

Keep lead lengths short between the two tubes, you want to avoid making a push-pull VHF oscillator (remember my recent post, I was able to coax a 01A to oscillate at 110 MHz!).

> Also, since both will be used in an oscillator
> circuit, such as Hartley, Meissner, TNT, etc, how close should the two

If you have a tube tester that tests Gm or emission, I would start there. I have a Tek 575 curve tracer I've used to actually get the plate curves, and if I wanted to really chose the best match from a stash of a particular tube type I'd try to match the curves as closely as possible. But that's probably not necessary. You can also test them in circuit after you've wired it up by measuring plate current, grid current, grid voltage

independently for each tube. You can also pull one tube at a time, retune as needed, and see if you get approximately the same RF power output from each tube. As far as quantifying "how close is close enough," I don't know. If the final product works to your satisfaction, declare success and move on ;-)

Ok, so far I've got some half decent results, nothing yet above 1/2 watt output but it's stable.

A pair of 47s amplifying in pushpull DSBSC at 14 MHz, stable and no sign yet of trouble. I haven't installed any neutralizing caps.

Buffer is a 6AG7 capacitively coupled and tapped down on the plate tank of the 6AG7, via some homebrew coax (small copper pipe with a wire stuck through it) coupling it to a pair of small trimcaps which balance the signal to the 47s.

Across the output dummy load (47 Ohms) I'm measuring about 12Vp-p, that corresponds to something just under 400mW I believe. I'm feeding 160VDC to the plates of the 47s and when I unbalance the output stage the plate current draw is about 30-35mA. So I'm sure that I still have work to do in the output matching network as well.

More later, I won't be able to do much work on it this weekend, hopefully next week will be better.

Very interesting, Geo.

Can you post a schematic to the group? (a scan of a crude sketch of one is fine - just want to see the circuit).

I hope eventually you'll replace that new-fangled 6AG7 with a proper pre-octal 2.5V heater tube ;-)

Agreed about the 6AG7, I'd like to stick with older technology where possible!

I'll try to draw it up and update photographs soon since I've changed the transmitter quite a bit since taking earlier photos.

Geo,

The Gross CW-25 used a 47 oscillator driving a 46 buffer/multiplier followed by two 46s in parallel. Plug-in coils were available for bands 160 - 10. I found two more examples of this tube lineup. One is a George Grammer construction project covered in November 1932 and February 1933 QST. The second is the Collins 4A transmitter (running on 20 w/o the 46 buffer/multiplier). Bill Orr also had a construction article in November 1971 issue of CQ (but 80/40 only w/o the buffer/multiplier stage).

I recently built a similar transmitter but without the 46 buffer/multiplier. It works fine on 80 and 40. With about 300 volts on the plates of the 46s and the 47 it loads to 15-20 watts input and 7-10 watts output. See my blog at
http://w0vlz.blogspot.com/search/label/1934%20transmitter

Now I'm working on an amplifier to go with it. See
http://w0vlz.blogspot.com/search/label/RF%20Amp

Does anyone have a Gross CW-25 they might part with? My elmer/stepfather (then W5GST, now K5CF) started with one in 1938. I'd like to put one on the air.

I am thinking of an amp myself. Living in the ham desert here I think I need a bit more power to make my TNT practical. I may double the B + and see what happens but so far despite indications that all is well including outdoor field strength I have yet to have a QSO with it. A couple of times I know I was heard but not enuf for a QSO . They could just tell I was in there and responded. Worst time of year for it anyway really but I dont give up easily. Every night I send a string of CQs on or around 14040 in the hope this will be the night. Truth be known every morning too.
I hate to monkey with the Power Supply because right now everty ody is happpy and there are no issues.
I even have a commercial Rx on back up . There is a fair amount of activity the last couple of days but nothing too strong. might go on the hunt for a #10 tube or something. Hope you get yours cooking. If you need a sig report just ask.

Ok, i managed to score a few type 41 pentodes from evilBay. I think they'll do the job in place of the 6AG7 and the ratings are within what I need - there's no sense in having a buffer tube that's beefier than the finals - plus the filament draw is lighter on the power supply than the 6AG7 so that's a bonus too.

I hope the 41 will have enough screen shelding at 14MHz but if the 47 does (and I saw that it works) then I imagine the 41 should too.

I might end up having to do a big rebuild if I need to put a bigger mains Xformer. I'm already heavily taxed on breadboard real estate.

Geo,

The Gross CW-25 used a 47 oscillator driving a 46 buffer/multiplier followed by two 46s in parallel. Plug-in coils were available for bands 160 - 10. I found two more examples of this tube lineup. One is a George Grammer construction project covered in November 1932 and February 1933 QST. The second is the Collins 4A transmitter (running on 20 w/o the 46 buffer/multiplier). Bill Orr also had a construction article in November 1971 issue of CQ (but 80/40 only w/o the buffer/multiplier stage).

I recently built a similar transmitter but without the 46 buffer/multiplier. It works fine on 80 and 40. With about 300 volts on the plates of the 46s and the 47 it loads to 15-20 watts input and 7-10 watts output. See my blog at
http://w0vlz.blogspot.com/search/label/1934%20transmitter

Now I'm working on an amplifier to go with it. See
http://w0vlz.blogspot.com/search/label/RF%20Amp

Does anyone have a Gross CW-25 they might part with? My elmer/stepfather (then W5GST, now K5CF) started with one in 1938. I'd like to put one on the air.

I just tried the TNT at 300 volts B+ in its current configuration. Power came up a bunch. Still it made me nervous so unhooked it and went back to the regular supply which gives 135v to 137v keydown. I think 200v would be a better b+ so i may work towards that. To be honest at 300 it scared me a bit. It seemed a dirtier signal although it might just be too strong to monitor in the same house. It was bouncing the through-meter off the peg on 5 watts. It works nicely even on 135v so maybe I just should leave it alone and store it till winter.
Back to the Am project.

I came to a conclusion that my current layout will not do, so today I was working on constructing a suitable wooden frame to house an improved version.

Unfortunately during this construction I had a bit of an argument with a power tool and I lost, so temporarily the project is on hold until my right thumb is better.

Total heater voltage rating will be 124V ac. Average here is (and incidently, at this very moment) 121V so I should be ok. I am first in double phase . Next pole east is end of 3 phase. Coils will be next part of the project and on off switch and fuse.

To the Group--

We have to apologize for the lateness of our July issue with the all-important convention registration card. At the last moment we ran into an unexpected problem that required us, midstream, to transfer the Journal to a different printer.

We are back on track now, with an expected mailing date of July 25th. Because of the lateness, we'll be using First Class mail rather than Non Profit Class as we have been doing recently.

In the meantime, the registration card is available at the convention web site, http://www.awaconference.com

You can register there on line.

We apologize for the inconvenience.

Started mounting the coil sockets today. Both Rx and Tx will have identical tubes and identical coils. They also share a multi gang variable capacitor. I know I have probably bitten of more than I can chew but I am runnng out of room anyway so a long term project will help! But the problems I have are of a more mundane nature. I have probably 5000 resitors. Doesnt appear to be a 100K one in the bunch. I need several. In a weak moment I felt like making up a parts list and just order it all. I also seem to be out of terminal strips. Spent an hour sorting resitors just now.
Anyway the bulld continues. I have the switch and one of the pots too.
both Rx and TX willl be hartley based.

The 41 is closely related to the 6K6 (IIRC) so you may be able to find an existence proof of a 6K6/G in a 14MHz application. It's not as bad as analyzing comparative scores in football but it's certainly not a perfect process either especially if you consider that these tubes are audio output tubes first and RF tubes by adaptation.

Best Wishes,
Coop, AA1WW

Don,

How many 100K resistors do you need, and what power rating? I have some NOS 100K 1/2 W I could send you if it's a reasonable quantity (for your project I don't imagine you need too many). Also, describe what you require for terminal strips; may be able to help there too.

Thanks Larry, I made an executive decison here. I need so much and none of it very expensive I am going to sit down make a list and just order it. The big stuff I already have so my out of pocket will be small. I could fudge many of the values but then you always wonder how much that hurt the project. (At least I do. I know that in the enginebusiness a seemingly minor sub can cost mega HP) I can use Gervais in Ottawa or there must be someplace in TO or Mouser or digikey on-line. I already ordered new tubes . Interesting in my search for parts downstairs I found a 4-125 ceramic socket with door knobs hanging off of it as well as two Johnson ceramic twist-in 4 pin socket for bigger TX tubes.

gep reply
I have a very good antenna. I use it with my big rig and can crack pileups on 20 at will. almost. I am often asked what power I am running in my amp with the big rig. I have to reply "What amp? I am running baerfoot. "Sometimes they ask twice . You know one of the big problems is getting anwered rather than being heard. I remember when I first got my ticket many years ago and running month wth no contacts. I figured my rig was no good but when i did get finally a QSO my signal report was excellant and always was. I find mself sometimes not answering a CQ because i found the fist hard to read. Maybe a bit fast for instance just above my comfort level. I try to stop myself from doing that since most can slow down . Most successful contacts have been skeds.
I have a 45 tube in now and am running to my vertical. I have been on 14076 banging away. Meter is showing just over a watt output at 135 volts and a lot more at 300 volts (pins the 5 watt needle on dahs.) I have monitored it at the 135 and done some field strength tests. Signal is as I would expect based on my other 50L6 transmitter test. At a mile away it is still a strong solid signal. Almost swamps my hand held receiver. I have found if it is good at the location it is good all over. It is like that with my other rig (50L6)too. If I set up a sked it is ususally successful and when it is not someone else can usally hear me anyway and will answer or give me a signal report by email. if I just call CQ I have had one answer in 3 years. We need a place to play and a group of willing players I think. IMHO
Anyway I am puttig it away for now. Got other fish to fry.

Fellow Hams,

We are in danger of losing perhaps the world's best radio location QTH - old WOO Ocean Gate, NJ AT&T Long Lines transmitting site.

Just brief outline. The site is on the mouth of Toms River flowing into the Barnegat Bay, just below of town of Toms River. It is peninsula about 175 acres, surrounded by another about 200 acres of salty marshes. Channels supply salt water to flood the plain. Absolutely quiet, no man made noise. See the photos at http://www.teslaradio.org/site.htm

Two story building, like a fortress was housing 10 and 50 kW transmitters that fed some 45 Rhombics, 5 Discones, two wire LP on 100' towers, with 1 5/8 heliax. Building has about 2 acre fenced off area. Building and antenna fields were designated historical sites. There will be no residential or industrial developments there.

The site was leased to Tesla Radio Foundation and Museum by the township, for two years, and then extended for five years. More info about the project is at www.TeslaRadio.org<http://www.TeslaRadio.org> web site. We were trying to have the AT&T and Tesla Museum, Club house and competitive M/M station there. I was not able to devote planned time and resources to get the project off the ground due to family and business problems and commitments. There was some vandalism done to the site. Township is getting concerned that not much was done to preserve the site and is looking for more reassurances that project will be progressing.

What I have done so far, we have registered NFP Foundation 501 (c)3, have a bank account, PO Box 9, calls N2EE and NT1E. Now with my involvement with MountainView Resort and getting up in the age, I will not be able to devote as much time as I was hoping for (retiring there).

We are trying to solicit more members and work with other Tesla groups, but more hands and heads are needed.

This is perhaps last call trying to save this magnificent and historical site and build world best radioclub station.

I can see some possibilities:
1. Expand the club with active members, solicit donations.
2. Group or club take over, perhaps Curacao style (shares).
3. Someone purchase the building and site.
4. ???

I am willing to help in any way I can, especially in the technical aspects, antenna and station design, logistics, etc. I have rigs and hardware to equip MM.

We also have nice, historical beach house around the corner from the site, which we would consider selling. Perfect place for contester to retire and dominate the bands.

If you are interested and can help, please come to our Tesla Radiofest BBQ this Saturday, July 23, at MountainView Resort in Glen Spey, NY www.MVmanor.com<http://www.MVmanor.com> and lets try to figure out how to save this Radio Jewell.

Be extremely cautious. Check out everything before donating your money to this project.

It is my understanding the local municipality owns this site, not Yuri.

While the site is nice, I believe it will take many hundreds-of-thousands of dollars to even partially restore the facilities. Overall, it is in deplorable condition. The building floods during extreme high tides and needs a new roof; and the antennas are old and have not been maintained. And it site is subject to NJ wetlands regulations and requirements and hefty fines for violations.

If you want to donate, fine, but please check it out first.

73, John Dilks, K2TQN

That is an _excellent_ book Lou. I had the XYL buy me an original used hardbound edition for Christmas a few years back. 657 small print pages was too much to view on the laptop and it would have cost as much as the book did for the toner used by the printer to generate my own hardcopy, hi. My copy was from a Library and is stamped "Discard" in red ink on the inside covers.

The on-line version is great for doing text searches, which I've used many times in the past few years.

AWAGroup friends--I am interested in finding a decent Heathkit AC-1
antenna coupler. There is one on e-bay:
http://cgi.ebay.com/Heathkit-Model-AC-1-Antenna-Coupler-/230653437915?pt=LH_DefaultDomain_
0&hash=item35b40427db
. Is anybody familiar with the AC-1? Does this look like a decent
one? Many thanks. Jim.

AWAGroup friends--I am interested in finding a decent Heathkit AC-1 antenna coupler. Looks gud, Dusty. The original RF connecter was a porcelain feed-thru for an end-fed ant, but the coax connecter is a common mod.

Is anybody familiar with the AC-1? Yes. Used one along with a AT-1.

Does this look like a decent one? Yes, except for RF connecter mod.

With this, an AT-1 & a VF-1 VFO you'd be in business ala 1954.

73, Lou

3307. TNT AM

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-08-01 11:57:48 UTC
From: Don
Topic: 3307 Message: 3307

The recent discussion on AM had me thinking. I had bought an old navy push to talk carbon mike at an antique store and had been experimening with it and an audio tanslformer battery set up to see how it worked. I had changed the three element plug for a 1/4" one and so yesterday on another sight when I saw someone say you could modulate a low power tx with a carbon mike in place of the key (no audio trasnformer required)if it was cathode keyed. I unplugged the key in my cathode Keyed tnt (also wired for a three elemnt 1/4 plug, two end elements only which are the two active contacts in the carbon mike as well.)and tried it on a dummy load (11 watt light bulb) the signal changed on the meter I was using but inversally to my speaking. A near by commercail rx did not indicate any freq shift but the 60 cycle AC from the direct heated tube was overpowering. I suppose that inverse reaction is because resistance increases with sound level so when I speak a peak the resistance rises and makes a mirror image of it voltage wise in the cathode circuit(opposite). Anyway I didnt try it beyond that since the TNT is on AC filments and would be too noisy but I will switch to DC battery power for a test. Might be a waste of time but is fun to try.
Don VE3LYX
MMM I think my 50L6 TX (now a 50C6) is also cathode keyed

Hi, Don,

Interesting experiment.

As I understand it, the resistance of the carbon element should decrease with a positive pressure, and increase with negative pressure, and the amount of each is proportional to the pressure (sound level). So on the surface, it doesn't explain the negative "carrier shift" (reduction in average power out with modulation) you seem to be observing. It could be a function of light loading, or something else limiting the positive peaks. Or maybe the characteristic of the specific mike you are using is asymmetric.

I also cathode-modulated my PP TNT once as an experiment. Got almost no AM but a ton of either FM or PM - it could only be slope-detected on an AM receiver. There was no audio from the monitor receiver unless I tuned off-frequency to one side of the carrier or the other, but if you did that, the audio sounded clean and pleasant. I did make a few solid contacts with it (at about 3W carrier out) up to about 100 miles away in daytime conditions. I didn't use a carbon microphone; I used a tube series-modulation scheme (a pair of parallel 45s) in the TNT cathode lead, with the 45 plates directly tied to TNT filament AC supply center-point. I did not experience any significant hum problems.

Keep us posted on further experiments!

Actually, that's not what I was saying. Please note that I haven't studied "carbon microphone theory" much, so I could be wrong. But from what I understand of the physics involved, there should be no change in AVERAGE resistance with SYMMETRICAL sound pressure waves on the diaphram. So, what you are seeing is most likely asymmetry in your voice. The human male voice is known to have this characteristic, and it is the reason why "serious" AM operators always take care to have the audio phased properly - in the proper phase, positive peaks will exceed 100% modulation while negative peaks are limited to 100% or slightly less. In the opposite phase the opposite is true. It is exceeding 100% modulation on negative peaks that is responsible for splatter.

You are correct that what you observe on the ohmmeter conflicts with the reduction in average output power with modulation you observed from your TNT, since a lower microphone resistance should result in more RF power output when in the cathode circuit. So that effect must be due to something else.

I just thought of another thing that could be happening, which could be the "something else." As the resistance of the cathode circuit increases, the grid-cathode bias will at some point get high enough for the oscillations to stop. I don't know if the carbon microphone will have enough "output" for this to happen, but it it does, I think the average output would decrease with modulation. The three-diode "keep alive" circuit I used for my modulated Hartley experiments prevents this effect - on negative audio voltage excursions, the plate voltage never goes below the "keep alive" voltage, which in my case is around 22V. The Hartley still oscillates FB at that plate voltage.

I did some testing. Direct carbon mike modulation of the cathode gives less than ten percent modulation according to my crude instrumentation. Not enuf. Pasting the Ac from the electromenchanical carbon mic style circuit does nothing on the cathode. This probably explains why people went to such great lengths to modulate their Txs. Now in a pinch , ie emergency i would try it in a second. Chances are a good operator at the other end could dig it out. Anyway I am on to the new Am stations set up. Fired up the receiver section today. In fact it is running right now beside me. Has a lot of hum although it isnt to bad on the speaker. I was missing one cap in the audio circuit and that may clean it up some. I will know better how it works tonite. Signal is getting stronger though by the minute so it may be ok. I will wait and see. The left side is the Rx and is a copy of the powerhouse circuit in 1966 Pop elc but with the previous generation tubes. (12sl7 and 50l6) Right side is gopng to be a higher powered version based on Bob Weaver's Am broadcaster he made for listening to music. Same tubes. as my rx in that too. 12sl7 osc and modulator feeding a 50l6 Rf PA. It is wired a bit but I have a lot to do there. I want to sort out the rx first in case the lessons transfer since the two circuits are not that differnt in reality. (two amps, one osc)Cabinet is something I picked up for boring a fellows Flathead V8 . it was in the deal we made.

Yes I thought about that too. you cant paly with the cathode without affectong the grid bias but maybe ecause it is derived from the cathode the change is somewat linear. Anyway i think you can say t works sort of. Sort of isnt a lot of fun so i am going to move on. (I did try the 50L6 rig but it just turns on and goes full blast. Doesnt seem to care what I am doing resistance wise. just a mere hint of conductivity and its ON! It was and is also cathode keyed.
it is probably a bit to hot for this idea .

Are the 12SL7 heaters on the neutral side of the line? If not, change
them so they are, it may help the hum situation.

I have sitting right in front of me a copy of Radio Handbook. Seventh addition first printing October 1940. On page 572 is an ad for Barker & Williamson inductors. So they are DEFINATLEY pre 1941
Sometimes vintage rules get in the way of fun I believe and if I were KING I would allow anything in the general spirit of the hobby that used period tubes and old style circuitry. Minor things like coils shouldnt matter. If they do then we should all have tubes in our PSs too. Of course not to appear too open minded I prefer a homebuilt rx as well otherwise it doesnt set well with me and is only half a station.
The Longfellow which is long only because of the combined power supply and transmitter is directly from 1934 Harmmalund short wave manusal which I have here somewhere. In that article the coils were made from bell wire. The same rig shows up in the 1948 ARRL handbook. I used to have a 1942 ARRL book too. I think it was also in there but cant be sure.
Don VE3LYX
BTW Anyone ever seen a VF1 or VF2 Biley variable crystal?

I'm either my own worst enemy or best advocate, depending how you look at it. I'm a purist in most of my pursuits. My intent from the minute I decided to build a vintage station was that the entire thing be vintage: transmitter, receiver, and power supplies. And that all use real vintage components except where that might prove to be impossible. I eventually came to realize that is beyond my means and I will have to settle for a compromise. But I don't have to like it! hi hi

Yes, I'm still around. I haven't touched the vintage rig in some time. I have a lot of important health and home stuff on my plate this summer. But lately I've been thinking a lot about the TNT rig, wanting to get it out and finish it. For the past few months it has been lovingly wrapped in two layers of plastic so as to keep any evil dust away before it's finished and photographed!

From: JAMES HANLON
Topic: 3328 Message: 3328

I'm not sure if the '46 Longfellow would make it for the pre 1945 AWA contest, but it would be very welcome on the Classic Exchange. You can get more info about the CX at www.classicexchange.org , but basically the CW CX will run from 1300 UTC 9/11/2011 to 0700 UTC on 9/12. There are suggested center frequencies for 160, 80, 40, 20, 15, 10, 6 and 2 meters, but most of the activity will be on 80 at 3534, on 40 at 7045, and on 20 at 14045.

The Phone (AM, SSB, and FM) CX will run on the following Sunday at the same times. Center frequencies for AM are: 80 meters 3880, 40 meters 7160 and 7290, 20 meters 14286. For SSB they are 3870, 7280, and 14270 respectively.

There is more info on scoring and on bonus points (for operating the same model transmitter and receiver as in your original novice station, and for operating a military surplus transmitter and receiver) on the web site. There is a scoring multiplier that is the sum of the ages of all of the transmitters and receivers that you get on the CX for three or more QSO's each.

It is a quite active contest, especially on CW. You will be able to make contacts all over North America. Drop in for a few minutes or a few hours and I guarantee you will have some fun.

73,

Jim Hanlon, W8KGI

nope.....what makes it 'long' is the unique shape...4-1/4" x 25"...many rigs have a combined power supply but they are not necessarly 'long'.

And I have no problem with that. U are entitled to build as you wish. It is the "exclusion of others" over some minor rule I hate. IE why would Longfeller style rig be inaccptable? Its a "control" thing. Glad you are still in TNT mode. I am setting my stuff aside for awhile too. Although I do operate every nite before bedtime. (3561)

I saw it too, and have the same sentiments.

Interesting, too, to learn that the 6AG7 qualifies as a 1930's tube, as it came out in 1939. It's always ben one of my favorites for xtal osc. and mid-level RF amp circuits, since, unlike most beam-power tubes and audio output tetrode/pentodes, it has a dense screen grid structure, hence very low Cgp. And they seem to have made a lot of them, so they're not hard to find.

Hi Larry,

The talk about the 6AG7 and its attributes reminds me of this story:

A few years ago I built a 50C5 osc from a CQ article by Dave K4TWJ (SK). It was called the 'Bare Essentials' (orig. ckt from the late '60s). It was an AC/DC circuit with a sparse parts count, using a wood bread board and brass tacks for solder points. Anyway, to my surprise, it worked. Yes, it had some chirp/yoop, depending on how it was loaded and the xtal. I deemed it a success, after receiving several OO reports...hi. Hang with me...6AG7 ref. coming. A week or so after receiving one of the OO cards, I got a small package in the mail. I wasn't expecting anything so when I opened it I was surprised to find a 6AG7, a VR tube and a few other parts and a real nice note from the OO regarding a much better osc. circuit, using the 6AG7 in a grid-plate circuit. He referred me to a 1950 QST article about various osc. circuits and tubes. To finish this, I built the test circuit in the article, using the 6AG7. You should have seen the hay-wire version...long leads, clip leads..etc, but it worked like a charm. I used no screen reg. and just tapped my windom onto the tank coil and it works great on 40 & 80 mtrs. No chirp or yoop. Now I have it on a small HB wood box and use it quite a bit....and of course, the 50C5 is still doing its thing.

My Longfeller uses a 6F6 osc and 6L6G final. Works good and was a fun project. Mine looks pretty much like the orig. using slat board construction.

I too was surprised to find this when I did a little background checking on it as I had always thought of it as a mid-50's favorite...which it was. It seems to have taken about ten years to become noticed and was starting to be heralded as the best tube to use for an oscillator, around the very late 40's, early 50's. This was the first time I have used it and was very impressed....and to echo your point...everyone seems to have a drawer full of them NOS and they are still cheap...good thing the audio junkies haven't found a use for them!

I also have a "bare essentials" and am on with it almost every night(3561 currently). I used a 50l6 and have modified the circuit some over the years but not much.Removed one resitive network as it was not relative when one actually studies the circuit and I have a VXO rigged I recently changed to to a 50C6 which I like better. Seems a cleaner set.Tamer. I have worked 567 miles as the crow flies for dx so far and got good signal reports. I have also worked Lou in terrible conditions. He thought it had some hum. Sounds clean on my monitor rx but who knows. I have though had some pretty decent signal reports with it. Output is pretty good for a single audio tube. I run it on a transformerless Vdoubler PS . I have thought about a longfeller though. I wonder if I have any 6ag7s. I do have 6l6 and 6v6 in stock.

Shhh!!!

I have a very nice audio book from the hollow-state era: James R. Langham, "High-Fidelity Techniques," Gernsback Library No. 42 (1950). Page 41 shows a pair of 6AG7s in a push-pull CATHODE FOLLOWER audio output circuit. (Not OTL, though.)

That is a tube I am not familiar with but I am a big fan of few parts and it works. Some of the simpler rigs work very well. I use my 50l6 (now 50c6) every night and I often try the 40M tnt too but I must say I am not a big fan of the tnt design.It works bt I dont have a lot of confidence in it. I am interested to see how my am rig will be . It is basically a MOPA with a modulator .
Anyway some of use rock bound guys should have a qso some night I think. I had my VXO switched in on last night to get some wiggle room. Not too broad a coverage but enough to make it useful.
I see some of the Bliley xrstal ads talk about variable freq xrstals. VF1 and VF2. I guess no one has any since i asked before. I am thining varying the pressure (spring pressure) on the quartz crystal might move it in frequency. I have some out of band xyrstals that can be sacrificed so I may try rigging something up to see if it does work. If one could get 15 or 20 kcs it would be wonderful. Best of both worlds.
Don

Speaking of electromenchanical modulators which we were awhile ago. I borrowed a 12 volt automotive ignition coil today (I rerally wanted a six volt but was unable so far to borrow one.)Falling back on my diploma in automotive I hooked up a WWII navy carbon mic to a carbon mc cirscuit substituting the ignition coil for an audio output transformer. . I was able with two semi good nine volt batteries to produce a peak of 103 volts ac by shouting in the mic. I could easily getting 60 to 84 VAc but had to talk loud. A strong voice would produce 4 to 32 volts.AC. No voice no voltage. I figured I needed a max of about 45 to make it work as a screen modulator. I have met that . Next is to try it. Since screen modulation is voltage and not current related it may actually work. I will try a telephone carbon mic later as they are designed for 60 volts dc so i am told. I should be able to get enuf to run a test anyway. The idea of a no tube modulator appeals to me. I have some xrystals in the 3745 range so I should be ok. It will be on the bare essentials set. I think if I reduce the screen voltage by the amout of my electromechanical mod normal peak output it should work. I am in uncharted territory for me (which is always fascinating.)

I think the best you'd be able to do with a 40M rock will be on the order
of +/- 1 or 2 KHz. Proportionately less for lower frequency XTALs and more
for higher frequency ones.

It's both. How much of each will depend on the tube. Screen grids do draw current.

Don't hold me to this but I seem to recall a "Hints and Kinks" where you would drilla small hole in the holder and tap it for a small screw the screw would vary the pressure on the spring that is on the xtal and shift the freq slightly. YMMVCasrl

Topic: 3349 Message: 3349

After lunch I hoooked it all up ugly feedingthe screen pin of the tube from the coil tower and neg terminal (to tx ground) IT WORKS!
I gave my wife out Grundig radio shack crank radio set to crystal frequency 3637 . I sent her to the far end of the house where she couldnt hear me audibly. (she has bad hearing anyway. Needs lots of volume to hear you.)When I spoke normal she did not respond but when I gave a bit more suds to my voice she came running and said "I heard you just as plain as day." I asked was the voice garbled. She said no it was normal. (former school marm) so the idea or concept is good. Now to make it easier to use and improve normal voice use. I was pretty sure it would work as I worked out the ratios of the coil which is a transfomer operating often in the lower frequency range of voice in normal operation. At 7000 rpm which is by no means any limit the crank turns through 2520000 degrees. Firing every 90 degrees produces a frequency of 28000 per minute (cause we are in RPMs.) 28000 /60 gives us 466.66666 cycles per second. I can sing that note myself. A good coil can see 10000rpm in racing and more. Should be ok for moderate low power tx use. Probably no good for a tiny Tim voice however but who knows? I reserve the right to correct my math. Due to extreme excitement I may have errored. It is from these calcs though I figured it should work.

Nice job Lou.

Here are a few pix of my version. I added a on/off sw. and neon.

I use a 80m windom on 40m. Haven't tried it on 80 yet.

Gentlemen,

I have up-loaded the W5LET article in the Album entitled, "Bare-Essential Rig Elect. Illus.. Mar.68" These are large files so will print quite well. Due to their size, will remove the album in early September.

Don: Can't recall seeing a photo of ur version.

Bill: Tks for sending that along. Let's get on 80. Output? Sig quality? Shocks yet? How about a glamour shot? I'll add it to the above album and any others sent or posted here.

What is the value of a 1968 Tener today?

73, Lou

But not well :>(

There is a point during warm up keydown when the tube is still cold when it does work and can be heard but when full power is available nothing can be heard. I would love to think the rx is just being swamped but i dont think that is realistic. Also output at normal speaking voice is too low. You have to almost shout to get good output. I tried sveral methods. imposing the sudio onto the screen circut so far seemed to work the best. as far as getting some repsonse. Putting the transformer in the circuit (coil seconady winding) did not work well. Probaby because the secondary and primary share a common neg terminal and the battery voltage from the carbon mic circuit gets into the screen circuit. (Dc battery voltage) Coupling with a cap instead of a direct connection showed a wee bit of promise. I would like to try a telephone carbon mic but my brother Mr Bell telephone hasnt located his stash of ones Bell threw out when they started switching over. I may find a used telphone at a flea market or yard sale too. It may be i simply need a modulator tube whether i like it or not. The fact that there are points where it does work intriques me. Biggest problem though is you need to be almost at a shout to produce good ac voltages. Normal talking is under 4 volts which will do nothing . Shouting is over 100 V sometimes. So i gave me a nice try but no cigar. it does work sort of. Sort of is not good for much unfortunately.

On the left . This was with the 50L6 . It now has a 50c6 which is a nicer older style tube (beer bottle shape)with same pinout but better manners. It now also has a rf indicator lamp. Output is strong for what it is. (over 5 watts out but under 10.probably around 8 I think would be realistic.) I actually really like it. I have also added a VXO I can switch in and use it if need be but usually not. Here is a pic of the front as well. Works well ,cost little and has good range . Whats not to love?. Seems to me the original article suggested you would use a 50L6 as well. I did.

Here it is with its current 50C6 tube. Looks vintage now. I dont know when the 50C6 came out but I am guessing long before I was born. I have had it for several years but only recently started using it. Why? I guess I ddnt really think it would work as well as it does. Some of you have heard it on air.

I hope so! I finally resolved my post-ice storm 80 meter antenna problem. I believe the new antenna should be the best I have ever had on that band, but have not had much opportunity to test it this summer.

I have been thinking a lot about finishing the TNT lately but the thought of another aggravating round of attempting to paint the meter keeps putting me off. I will get to it, eventually!

Hi Lou,

No coil for 80 yet with the BE. The sig quality is pretty good, but does have the tendency to bring in a few OO QSLs. Being its ac/dc, it has a tad of hum and a little chirp, but really not bad for what it is. Probably about 8 watts input and lights a pilot lamp in the windom feed line pretty good. So far on 40, have worked stns up & down the east coast. So far no shocks, but I'm always careful. I also have to watch out for a cat that occasionally likes to walk around on the bench. Oh, and nothing glamorous here but glowing tubes...73, Bill K4JYS

Carl. I will probably try anything. I got fooling around with a proper Am build and when i got involved in picking a mic I learned about the wonders of carbon mics. I wondered how far could one take this and got carried away. The fact that it does work in some conditions no matter how unusual they are makes me think it has possibilties. For my BareEssentials tx.. I did a lot of testing yesterday and today. Some success but nowhere yet usable. So how would you do loop modultion? Or are you just rattlin my chain. I am thinking to wre up this tx so i can apply modulation easily to the screen grid in what ever manner I have to use. I havent yet tried it with reduced screen voltage but should . Anyway I am back in Cw mode tonight and pounded some brass for awhile on 3561.

From: Don
Topic: 3370 Message: 3370

I did some further testing last night. Seems my jury rigged installation was picking up 60 cycle hum and was actually moduating but hum was strongerthanmy voice. That is why it works on tube warm up but when all comes to life it doesnt. I tried theset un hooked to the modulator back inits original position. using a radio about 60 feet away (a DX394) I taped it with and without the modulator hooked up. Signal is clear and quiet without the modulator hooked up I used a tape recorder to record all my tests . When I have the modulator hooked up withits three feet of clip wires and even just key it Hum is very strong. The only reasonable explanation is it is picking it up from the extra wiring since the circuit is unchanged. I will make a proper modulation jack I have wanted to rework the set for awhile anyway.
40M TNT east coast.BTW I would love to here your TNT on 40M. Even just to listen. When and around where do you operate?
I am also going to investigate this Variable crystal thing more. A 160 M crystal with a doubler or tripler would make a wonderfully stable and simple VFO. It would be devoid of hand capacity effects. Swing avaialble would be quite high on 40M. Certainly mre than anyone would need and a trim cap would add more adjustabilty. Front mounting the crystal with its unique knob deal would be even better.
BAREESSENTIALS rig.
He does mention in the article as i thought you can run a 50L6 HOWEVER a 50C6 which looks like a late 20s early tube and is for sure pre 1940 has much better manners. power output is higher . It was designed for +200 where the 50L6 and 50C5 are not although they wil run there and it is just a lot smootherrunning tx with it. On drawback is it has a long warm up time. Maybe double the 50L6. It takes a couple of minutes till filment is bright and full power is avaialble BUT if you want a simple rig with a big fat tube that performs well, looks good and is easy to build it is a good one. Grid bias is different (-14 vrs -7) but it works well as is anyway.
DON VE3LYX
50C6 were easy to find NOS in box. I just bought a pair a couple of weeks ago.

This discussion has sparked new interest. I pulled the BE rig out of the ham cupboard and rewired some of it. I place the crystal socket on the front panel and changed some of the wiring (rerouted) I am seriously thinking of moving the PS off the tx and onto a seperate remote board. I may add another filter section. I have added a key click filter as well.
Now who wants to sell a Bliley VF1 or VF2?

> tonight and pounded some brass for awhile on 3561.
> Don VE3LYX

Hi Don,

To properly implement screen modulation you need to reduce the DC screen voltage to the point where the RF carrier output is no more than 1/4 (25%) of full CW output. So if your peak CW output is 5 watts, reduce the DC voltage on the screen grid until your RF output is 1.25W (or a little less to allow headroom for assymetricaly positive peaks, say around 1.0W). This is probably why it only works for you during the warm-up phase.

Also, you would have to float the battery/carbon mike circuit at the DC screen voltage to use the ignition coil as a screen modulation transformer.

Hi Don,

The ST tube envelopes (like the 50C6 you posted) didn't show up until sometime in the early-to-mid 1930s.

Also, I don't think the 50-volt heater tubes were available until sometime in the 1940s; maybe someone with Tube Lore can tell us if the information is there. Heck, the first octals were the 6.3V heater metal tubes, and they didn't come out until 1935.

Thanks Larry
I knew I was chating just superimposing it but was surprised to get some result.
So I could put a pot or reo in the screen circuit and adjust screen voltage down till power is about 25% or less then apply my modulation. If I apply my Ac audio to the screen grid through a cap rather than a direct connection I am thinking it will still work. Am I off track here or not? Then the Dc in the coil mic circuit is no longer relevent as it wont show up in the tx circuit at all or so i am thinking.
Thanks for the tip

>I was unable to tell for sure but I my 1940 "Radio" Handbook the 50C6 is listed (characteristics identical to 6y6 except heater voltage)The 50L6 s also listed right below it. Since the 50L6 is a newer design (if even going by globe shape alone) I deducted with my twisted lttle mind that the 50C6 came before it so I am thinking late thirties and the 50L6 just before 1040. I searched a few sites but while I could find date data on the 50L6 (I think 1939 if memory serves me)I found nothing concrete on the 50C6. I am hoping to run accross someone with a say 1937 tube manual for instance to see. The 50C6 doesnt appear to be a popular tube howevwer when I decided to use one I found many at reasonble price very quickly. It seems to be much more cofortable in the tx than the 50L6. Note is cleaner for instance. Almost like it was happy there where the 50L6 was stretching itself. The 50C5 which was the minature in the original circit I have a history with. I have had two record players with one in the output and failure was regular as clockwork. Almost once a year. Remembering that is what sent me to the 50L6 in the first place when building the set. I took a quick look in my junk radios and discovered I had two in stock but I have pooped one of them also (through a accidently disconnected antenna terminal) so bought several new ones. I was looking for a better tube and stumbled accross the 50C6. My personal feeling from running it now for a few weeks is it is a real good choice for the BE tx. Power is up slightly but I had more tha sufficient anyway. The set just seems to work better , more relaxed and run cleaner. I know as you may be thinking it is no good for a 20s set but for a 30s set I think I am on safe ground. And yes I have a great affinity for transformeless supplies Why I dont know but I have several all working well. Including BTW my homebrew monitor scope (transformerless quadrupler)which I have used for some 30 years now. Today with large spade /small spade plugs or three prong plugs assigning a "permanent" proper ground is a simple deal. That eliminates 90% of their troubles anyway. Other than that the rules are simple . "Dont touch nothin unles it is unplugged and key down to discharge." Working as a specialized tune up man for many years I am used to working around painful

voltages (15KV to 40KV)and have learned to behave. You may also notice all my rigs have face plates to keep my hands out.

Just beofre I go to the shop today i want to report on my variable crstal experiments. I have herea Bliley rock at 4042 which is of no use frequency wise to me so i sacrificed it. Forst i noticed i underneath is a set screw. On taking it apart I discovedthat setscrew controls spring tension on the crystal. I ut it back together and hooked it to my spotting crystal oscilator. (A 7400 chip ocsillator and a very handy device.) I tuned a digital rx to the frequncy andpresssed the push button. It was right on freq. i took a tiny screwdiver and back outthe ste srew. As pressure was reduced frequency rose. I loosened the front two screws as well and as I reduced pressure the freq continued to rise until the rock was no longer in sufficient contact. Freq change with this crude experiment was about 1 khz barely. It would take some stought pressure to move it 10 KCs (10 to 15 #) but even 5 would be nice.If I get time I may machine up a chunk of brass in the lathe and thread the centre for a very fine pitch thread bolt to explore it further. Meanwhile i am watching ebay etc for a real Bliley VF1 or VF2. Any freq since it would be a simple mattter to change the rock inside. Bliley variables were introduced just before the US entered the war. After the war they disappeared. Were not real popular but I suspect they work well. No reason why they wouldnt. Not every good idea is well received I have learned. Ok Sorry for multiple posts. I will go to my man cage (garage) now and leave you folks alone. Thanks for all the tips BTW . I am paying attn.

I made one up today starting with the Al' ingot I cast last fall in my small foundry. I finished it about 3 oclock and repeated the tests. Results are no different than with the underneath set screw. Almost a kc.(1 khz)
So it works but not as well as I had hoped. Still it is usable. I still need to see if it works in my VXO circuit and what the total range is. (how much more will the cap' pull it.)
Here is the ingot before maching. here itis al assembled . i used an 8mm bolt for the pressure screw and machined the end to fit a 1/4 knob. Here it is installed in my Bare Essentails rig.
Anyway i learned a lot which is aways interesting to me.

I wonder if the Bliley 'VF' models may also have used a different cut of quartz...something that might take a bit more warping than a normal cut yet still vibrate?

Could be. Remember this is a just a first try. I used existing hardware IE spring etc. A stronger spring could easily have been made which would allow greater compression. Judging from my experience with fuel regulators I am guessing I am making 5 to 7 lbs force. More would be possible. I am also not squeezing beyond spring compression. I dont want to crack the quartz. I did test to see if it still responded to extra Cap even when compression is changed . I used a 68 pf to see. It does. And the change appears to be the same amount whether compressed or normal tension. I found an old ad. Says an 80 meter VF1 varied 6 kc and a 40M 12 kc. I assume but dont know for sure that a VF2 was even better.I also have been talking to a ham named Bliley probably a grand dson and he tells me they had developed units with 200 kc swing before the war but they were never in production if I understood him correctly. Adding some variable capacitance to the unit which would be no problem for someone with camera or clock making skills would add additional swing. I just guessed at how it was done but probably only have a piece of the picture. Still I do now have a variable freq crystal. Gotta find a original. Someone has to have some.

I think this refers to the 80m xtal when used as a doubler, resulting in a 12 kc shift on 40, rather than a 40m crystal swinging 12 kc. From Lou's picture of the internal workings and Bliley's description, it seems that the process is a little more complex than applying pressure to the slab's center with the screw...note the unique shape of the pressure plate contacting the edges only. It will be interesting to learn the results of any further testing Don.

The ad said after it mentioned the 12kc with the 40 "more when doubled or multiplied" so I suspect the effect is greater the higher the frequency or it moves the rock a percentage rather than a specific number of cycles. However at first my instinct was the same conclusion you mentioned. You may be right about where it is compressed. I am also wondering as I already asked Lou what is underneath. Are they compressing the crystal or the spring with the crystal sandwiched between.(like I am.) Got other "fish to fry" today but I may make up another face but off centre to see what happens. Takes several hours to machine one up though. If I knew it would work properly I would make a foam sample and cast it which cuts machining to a minimum.

In a moment of inspiration I removed one screw and offset the contact point. I was able to get as low as 4040.4 kcs but it was tricky. When reaasmbling it I left it somewhat loose allowing less at rest compression while still having the abilty for full compresssion. It extended the range some more. My 7400chip osc does not like the big old crystals. Hard to start but it does eventually work. My only CW band 80 meter Blilley does not gisassemble but is rivited. I hate to take it apart but I may anyway. It would be wonderful to have even 1.2 kc swing. I tried solid compression but osc wasnt stable on start up althogh setttled down but I was not able to change freq with additional squeeze then.

Hi Lou,

I wouldn't say variable condensor---more like variable pressure, i.e. the less pressure applied to the crystal by the screw, the lower the frequency of the rock...conversely, the tighter the pressure, the higher the frequency.

It'd be interesting to see what sorta variation one might achieve by placing a small trimmer capacitor in parallel with that crystal, and/or in series though...but maybe that idea has already been touched upon here...

Yep.

It depends. If the source impedance of the DC screen supply is high
enough, yes. For example, if you use a series voltage dropping resistor
(not a voltage divider) from the plate supply, and the source impedance of
the modulator is low enough, it may work. It's important because this is
now a shunt modulation scheme, rather than the series modulation scheme
you had before. In either case, you still need to adjust the screen
voltage for 25% or less of full CW RF output. I think you'd have less to
worry about if you stuck with the series screen modulation, and floated
the carbon mike and battery; it has a better chance of working with the
parts you have at hand.

> Then the Dc in the coil mic circuit is no longer relevent as it wont show
> up in the tx circuit at all or so i am thinking.

You are correct there, but I think floating the spark coil/mod xfmr, mike, and battery in the screen supply is the lesser of two evils. This way you can use a "stiff" screen supply and it will still work. Just make sure your mike is well-insulated - safety first!

> Thanks for the tip

Actually it goes the opposite. More pressure lower. Sort of like stepping on a snake . The harder you press the less he wiggles. Eventually he quits wiggling. So does the crystal.
You can see the inside of my device. And you can see clearly the various pressure points I tried.
However think I know now what to do. Spaeter...

I wouldn't say variable condenser---more like variable pressure, i.e. the less pressure applied to the crystal by the screw [Not pressure, but spacing of top plate relitive to xtal. See agn below from VF-1 description]., the lower the frequency of the rock...conversely, the tighter the pressure, the higher the frequency.

It'd be interesting to see what sorta variation one might achieve by placing a small trimmer capacitor in parallel with that crystal, Freq goes down...

For most of the adj. dial travel in the top plate is not touching the xtal at all.

Don. My VF-1 was a gift long ago. As always, look on eBay. Lou

Ok
I made a compressable condensor using card stock and aluminum foil.I had the alumnum foil on the crystal , a card stock seperator and then the steel plate.I could hear it wanting to start in my monitor radio (hssssss) but the little low power chip osc didnt have enough suds to get it going. That would be a series cap. I tried it with my 68 pf cap in series and it wouldnt fire right away but if I waited long enuf it would eventualy oscillate. So the idea of a series at least is probably doable but not with the spotting oscillator . In the tx with real voltage in it I suspect it would kick right off. However my tx works in the low end of 80 so no point in trying it in there. I do have a 5 watt input homebuilt 80 solid state Tx under my vintage stuff. Hadnt thought of using it but I will for the next test. It probably doesnt care as it has a broadband final rather than tuned .
So if I am reading it right the VF1 uses basiically a variable cap to change its frequency.? I am using crystal compression. I am thinking it reality your VF1 it is using a bit of both because the variable cap is a springy thing so even when it is being compressed to change its plate spacing it is also varying the pressure on the crystal. Not particuarily unlike and ceramic style trim cap which is an angular cap rather than parrallel till snugged up.
I discovered you can run the cystal looser than as delivered and it still maintains solid frequency. I was able at one point yesterday using compression alone to get from 4040.2 to 4043. The combo of cap and compression similtaneously should give me double anyway if I can make it work. I gotta take a break though. Spending too much time on this I fear and may encur my wifes rath.
Apparently among other things the grass is growing ;>)

Good luck!

I'd keep the whole AM part outboard, if it were me, for this retrofit/experiment.

I think the oil in the spark coil was mostly for HV insulation - there's 10's of KV in the secondary winding - but for this application you can probably get on without it. Or you can put the oil back in after the mod. The oil may have also served for cooling, but I think that would have been a secondary consideration.

Another thing you may want to try is using a small audio output transformer - like from a AA5 table radio - as a modulation transformer. Use the original primary in series with the (reduced) screen supply and feed the speaker output from a small audio amp into the speaker winding (original secondary). Like I've said previously, you need to adjust the DC screen supply voltage for about 20% - no more than 25% - of maximum carrier output.

Today I rebuilt part of the bare essentials rig. I moved all the ac wiring to one side . I moved the tube forward from the power supply termnal strip. (About 3/4 inch) I split the screen supply line and routed it to a newly installed jack so I can run input to the screen or bypass. I have a hard tme getting screen voltage down to kill power output. because current is low on the screen I will need a lot of R I think. I tried 50K pot. Virtually nothing. I tried a 500 K and was able to move it about 10%.
I put it back on the air and on my monitor I can hear a nice clean BEEEEEEP. instead of a Buzzzz so i am thinking I did some good. I also experimented with the VXO . I can move the 3561 crystal over 2 Kcs but not quite 3. I have only a ant trimmer as a VXO cap. Crystal likes runnning with the cap. Note seems a bit purer. So if i made this a compression variable crystal I would have over 4 KC as is. If I put a decent cap (5-50 or 5 to 75. pf)in the circuit I might realize a bit more.
Maybe friday I will start seriously on an outboard modulator as per my carbon mic stuff.

I have the audio transfomer right here. It has been involved from Day one. It is from an old AC DC set. I have to work at getting the screen voltage down. more. So far I could only move it about 10%.. I may have to dig into my "Green" resistors.
Anyway I am working toward it as you suggested and yes the whole modulation deal will be outboard with a shorting jack in the front panel of the TX to reconnect the screen as is when modulation plug is removed.

From: Don
Topic: 3405 Message: 3405

I should also mention just in case anyone has an interest that with the 50C6 the bare essentials rig is according to my meters no longer QRP. After the clean up and a couple of mild circuit reworks it is banging my watt meter well past 10 W on every key stroke.In fact I was thinking it is no longer "a bare essentals" rig with a built in switchable VXO (uses a violin "tuning" peg coupled with a neoprene vaccum tubing to "tune" the ceramic trimmer)and now a modulation jack plus plenty of power. I am really beginning to like this set.

With the modulation transformer secondary (=output transformer primary or spark coil secondary) in series with the screen. you can use a "stiffer" screen supply like a voltage divider, You should be able to dial the output down to zilch with that, since this is an oscillator stage, not that you want to go that far. (If it were a class C amplifier there is usually some residual RF output even with the screen-cathode voltage at 0V.)

Thanks I am thinking after a day of further testing the radio as is does not lend itself well to becomng an am set. I would have to build a voltage divider network to properly control the screen voltage. When the tube is warm and you switch to the no sceen voltage (open jack for instance) it will still transmit if you leave the key down for a few seconds. Once it does it will keep doing it. When started and nornal war up it does not do that but has some output around 1.2 watt or so. If I build a divider network I can give it what it needs. I am getting some modulation but I doubt anyone can make anything from it yet. Maybe a real pentode instead of a beam power tube would be easier to do. But here Larry is the real crux of the matter. I have right now a beautiful working I tube CW tx, I hate to change much on it since its perfomance is beyond my original expectations. I am building a 2 tube Am tx so I may just let this be for now and use the carbin mic circuit forthe 2 tuber which insures it has suffucient punch to modulate. I may try more later . Right now I am building the carbon mic modulator anyway with the audio transformer . I will try it on the other circuit with just the single tube first to see if it works there. Tis frustrating to have some success but not useable amounts. However I am thinking of your advice and how to implment it . I may build a dedicated test bench tx. I have all the parts so it would cost nothing.

From: Don
Topic: 3410 Message: 3410

SO I went back to work on the new Am rig. Inserting components and mechanically making the co9nections before soldering. I am down to less than a doz things left to to. I reworked the orignal circuit to use a hartley osc. I dont think it will cause any problems but since the rx has a hartley circuit and i would like the set to single track both tx and rx on a dual gang cap i thought if i made both osc the same basic design and tuning (Same tuning cap value and same coil and grid leak cap) I might be able to make it work. Could be the different gridleak resistor value will upset it but I am hoping not. 1/2 of the 12sl7 is a modulator and the other half a osc feeding a 50L6 with screen modulation as per Bob 'home AM broadcaster design. I am switching to a conventional tank circuit like used in the bare essentials rig. and taking the output ff with a link. I will have to put an Rf choke in the B + which feeds the 12sl7 plates but i think that should be easy to make. Some scramble wound insulated copper wire on a wood dowel is what I usually use. So I am off downstairs to find a pair of .1 uf caps for the circuit. Parts wise that is all I need. Who knows? I might fire it up today.

I never bought tips for my Weller guns. They are easy, and inexpensive, to make out of regular copper house wiring. Or, any nice solid copper wire of similar gauge as the original. Just shape it like the original with heavy long nose pliers, cut the ends about ¾ inches longer than where they enter the hold-down nuts, place the old nuts from the broken element on the home made tip, bend the wire over 90 degrees at the ends. Make sure they will fit into the cavity on the gun, and, insert new tip. Tighten down nuts real tight, turn on gun, and, tin tip with solder. You are ready to go. Been doing this for over 50 years. 73 - Mike

When Weller first came out with the soldering guns we used #12 copper wire for the tips because regulation tips weren't available out here on the "frontier." The only problem was that they wore out fast because they didn't have the big chunk of copper on the point. 60-40 solder has a tendency to eat up the tip, so I use 63-37 when I can find it. It still eats up the tip but not as fast.

Seeing all these construction projects on here with Fahnestock clips reminds me that I have a ton of them available. These are actually accessible, unlike some other items people occasionally ask for and I have yet to locate. The attached photo I just took with my cell phone. The first ebay ad is the exact item I have, but for a heck of a lot more money. The second ebay link is for current clip sales on ebay. As can be seen, these things are not cheap in most people's eyes.

http://www.ebay.com/itm/120540199360?ssPageName=STRK:MEWAX:IT
<http://www.ebay.com/itm/120540199360?ssPageName=STRK:MEWAX:IT&_trksid=p3984
.m1438.l2649> &_trksid=p3984.m1438.l2649

http://www.ebay.com/sch/i.html?_from=R40
<http://www.ebay.com/sch/i.html?_from=R40&_trksid=m570.l2736&_nkw=Fahnestock
+clips> &_trksid=m570.l2736&_nkw=Fahnestock+clips

I removed the clips by using a heavy duty hand held punch for the rivets. It may be quicker and easier with a drill, I just did not try it. I will sell these for $8 for 30 pieces (just for this group. In a few weeks I am going to a radio meet and will be asking $10 per package of 30, or 60 clips), or a total of 60 clips, postpaid in the USA. For larger quantities, or outside of the USA please ask. I can accept PayPal but in that case the price is $8.50 to cover their fees. Thanks & 73 - Mike

> Thanks both of you. I thought of using my hard copper wire and will try that but meanwhile I knew I had bought a small woodburner somewhere. I found it tonite and tried it out. it works very well and is small and can get in places i couldnt before. However. I did not put on my work shirt and managed during an inspection after soldering the last underneath connection to bump it and put a nice neat hole in my brand new Van Deusen shirt. So I have to do the wiring up top now. The modulation control and a 10K resistor 1 watt. I dont have any 10 K 1 watts but I do have three 33k 1/2 watts. Time to get creative I guess. And I need to pick a cap for the tank circuit. I have a 40 meter tank all built for the bare essentials that I never used. Since the tube is the same even though this is just a PA it seems like a drop in. I have a choice of several Variable Caps. I dont need full range on this tank , Just for sure 40 meters. I am at tha stage now where I am thinking "what if it works?" Probably wont right off but tis still exciting.

Don,

There is a lot more AM activity on 80 and 75M than 40M, and QRP power levels seen to do better on that band, here in the Northeast. If I were you I'd definitely include 3.5 - 4.0M coverage.

> -Larry/NE1S

Ok I will make it changable. I had the 40 M tank and ant link done so I will fire up on itbut I will whip up another for 80M. Around here most hams are on 2M. (I am not at all anymore) So I need to make it almost to your area place to have a QSO. The RX and tx osc coils are identiacl and from the specs cover both 80 and 40 using the tuning cap I have as per the Rx article. I wanted to limit it to in band tx only so by using a less tunable PA (smaller tuning cap) I can keep transmitter tuning to a narrower range. I can probably add a switchable fixed cap to make it work anyway.
Speaking of QRP I have come to realize that because of where i live I need a decent amont of power to talk to anyone. At least 5 watts + and probably 8 to 10 is ideal . I have several QRp solid state txs I built a few years back around the 1 watt level. Never had a contact with any of them although they al work very well. I fear QRN levels alone exceeds their output. If I lived in an HF Hamactive area I think it would be better. Locally the question is "What repeater are you on?"
Everything is mounted now . just a few more connections to make. Did a smoke test today. Went well. NO SMOKE and power is everywhere it should be. !

"Sammeln & Seltenes" What language is this?

Also, below is the instruction sheet for the GR 558 Ham wave metre. Anyone have a good copy? Need a hi-riz scan.

Thank you, Lou

I need to see more. "Sammelen" is "collecting" and"seltenis" is "rare". might not be my dialect but I can probably make it out. I would give it a shot anyway. Usually pretty good with languages.

Don't feel bad, I was beat out on a lot of his items. I was not at home at the computer when the auctions ended so I placed my bids early, and obviously not high enough. I was with my GF so cannot complain. Actually she save me a lot of money tonight as I would have bid high enough to get it. I really wanted that GR oscillator of his also. Only one I have ever seen. The crystal holder, I am almost certain I have a couple. But, again, who knows where, HI. 73 - Mike

www.ebay.de
look on left side of the page under the ebay logo you will see "Sammeln" (From which we get the word Assemble) Clicking on that brings up the seltenes. (seldoms) Same language just spoken different than our British based English.
He is a German and is bidding from Ebay.de.(Deutschland as Germany is a English term for that land.)) Money would be no object unless he is Schwaben like my ancestors. Otherwise owning it is all that matters. The price would be irrelvant because he probably has lots of $$$$. You might appeal to him to let you sneak an item or two by using kind words such as Dear sir. I see you are a most successful bidder of rare radio collectables. Unfortunatley I need this particular piece to complete my collection and wonder would you be so kind as to allow me to try. I will repsect you efforts in the future. Thank you L V or smething like that might work hard as it s to swallow but outbidding would be tough.

3427. Need help dating tubes

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-08-23 02:42:31 UTC
From: JAMES HANLON
Topic: 3427 Message: 3427

Y'all,

I needsome help dating a couple of tubes from a rig I just acquired.

The first is a Sylvania 6L6G. Below the 6L6G marking on the glass is the code D7M. On the plug-in base is a code that reads vertically downward either Z26 or 7 with a line under it and then 26.

The next is a General Electric GL-807. On the base is the code 635 (horizontally) with a smaller 274 underneath that.

From the age of the rig, a Millen 90800, I suspect the tubes are from the early post-war 40's era.

Anyone have any better guesses?

Thanks,

Jim, W8KGI

3428. Re: New AM rig Smoke test

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-08-23 14:56:42 UTC
From: Don Dulmage
Topic: 3428 Message: 3428

I finished wiring the set just now. I took the coil from the rx and plugged it in the tx . I turned on the power. Power on lamp lit. Tubes lit. I switched on the B+ to the TX section. (Switch on back of modulation control.) As the tubes warmed up the neon lamp in the screen circuit began to glow. I tried the modulation level control and could make a difference in brightness easily. I am thinking "this is good"
The RX is a straight copy of the Powerhouse Two tube set from Aug 66 Elec Ill but with vintage parts and 12sl7 anda 50L6 tube instead of the minatures in the article. I have had it working in SWL mode so I knew it was ok. The Tx is my take on the 1 tube Am broadcaster designed by Robert Weaver http://electronbunker.sasktelwebsite.net/OneTubeXMTR.html. I took some big liberties here. He used a compactron. I used a 12sl7 and a 50l6 to come up with the twin triode/ beam power deal. I used the osc circuit from the powerhouse RX , a hartley but gave it a tx style GDLK Resitor. Both rx and tx coils are identical. In the Tx output I used the Bare essentals Tank circuit rather than the Pi deal he did because I am used to it and have used it with a 50l6 in my BE rig. I moved the RFC to the PA plate supply before the tank feeding through the tank to the plate and fed the rest of the circuit off the corner. Other than that it is his circuit. Will it work ? I dont know. yet. I only do a bit a day and I may have made some wiring errors as I am not yet perfect but I hope it does. Both TX and Rx use the same variable cap. A dual section (1 section for Rx , one section for TX) from a 1920s radio. (Had 52 and 56 tubes) The PA tank has its own Variable cap.

From: Don Dulmage
Topic: 3428 Message: 3429

No joy yet but the Tx osc is working. I could hear it in the rx slightkly off freq about 700 hz. I swapped the two coils rx and tx and it was bang on. If i put my hand near it I could hear the tx osc shift off freq so that is good. Rf output is tiny. I suspect I have made a wiring error and will look for it. Tank circuit tunes and has proper voltage but somehow osc output is not reachng the PA. I am thinking even withn an AM rig there should be a carrier at least of some value maybe 25% to 40% of full modulation output. I have a real bad pot in the rx audio circuit so i have to find another 500k in my junk box. It happened during my smoke show last week. I will make this work. The question is just when. It could also bemy tank circuitdoesnt match my tx osc. I wil check that later today and may make a new tank coil and link. That would accont for the propblem for sure. I will take a portable Rx and find the tx osc freq and checkmy caculations and tank coil from there. Never a dull moment in experimental land.

The deffective pot turned out to be a defective .01 condenser in the 50L6 audio plate circuit. When pot reached a certain point it started acting stupid.So I was sitting there with pot turned up poking and tapping other components listening for that crackle indicating a bum unit and slowly I began receiving smoke signals. As the smoke grew i saw it was comong from a punkinseed condensor that was also leaking now. I clipped it from the circuit for now and everything returned to normal. I suppose It should replace it but I dont think it is super critical. It was new BTW .Bummer!
I check both osc=s The set tunes from 3400 to 14255. The two oscillators track within a few cycles of each other and can be heard with no adjustment switich one on and then turn it off and turn on the other.) So I have a rx and a tx that tunes 80 40 and 20 with no band switching. MMmmm! I may tune the tx PA tank to 20M (14.2 mcs) full open minmum pff setting. I should be able to get to 40M say 7.150 at full mesh and could switch in a fixed cap for 80m .

Mike & Don

I've been off the net for the past two days. Problem fixed this morning.

BTW, who is the winning bidder? - Mike At this point do not know. For curiosity sake only, I am hoping he will leave Feedback and with that, his eBay I.D.

He is a German and is bidding from Ebay.de. Tks Don... I must say that I am a LITTLE relieved that I did not win. If I had, I'd be fed grass & acorns while living in the garage for six months. That was a close one.

I have the holder c/w original crystal. Very good shape, but the hard rubber base is a bit sun-bleached at on end. You know how it is. Well, Mr. Cro does I'm sure.

73, Lou

Thanks Lenord,
I have found it too and printed out the schematic. i built the original from that article but subbed a real tuning cap and used a 50L6. I now have a 50C6 in it and it works real well. Takes a long time on warm up but power is up and note is nicer. .
I am sitting here typing listening to the rx from the Am rig. Currently Radio Hanoi . I will looki intot he tx tomorrow. TX osc is working perfectly ,In fact right now I can turn the Tx on and the rx hears the signal with no retuning. I need an either or switch for B plus Either rx or tx but not both.

Sorry, Lou; they were on the other list, AWA; I'm still not sure why
there are two lists with similar names.

I did look at the Contest entries, but not in enough detail to answer
your question. Geoff Bourne would be the one to check with; the AWA
site has this email address for him: gbourne at charter.net

This is under dumb things I have done. I popped both my 12sl7 tubes. filments gave out. I figured it was because of their recent manufacture in a land of uncertain quality so i ordered another set but decided to try med mu double triode 12sn7 . They came in 3 days NOS in old RCA boxes but they wont heat. Still the 50L6s ligh soi got checking with the voltmeter. Only 3.9 to 4 volts across the filments and the 50l6s are seeing 55.It was a racing weekend so I have been sidetracked for a bit but know am back at it. 3.9 volts will not light a 12 volt filiment. What happened. Turns out the 12SN7 has a high current filment compared to a 12SL7. They (two 12sn7)are not compatable in a ac dc circuit with a pair of 50L6s. bcause of the resitance voltage does not dvide up properly. I learned a hard lesson here. I didnt check specs first just knew they were similar. Current draw for 12sn7s is double 12sl7s so resistance must be half. Don VE3LYX

Hi Don,

The heater current for a 50L6 is 150mA, same for a 12SL7. So they are perfectly compatible, and the voltages should divide correctly for these two tubes in series. Don't know how you managed to burn out the 12SL7 heaters?

The heater current for a 12SN7 is 300mA, and, as you discovered, the voltages do not divide properly when connected in series with the 50L6 150 mA heater.

The 12SL7 triodes are high-mu, and the 12SN7 triodes are medium-mu. The 12SN7 is capable of higher plate current, so my guess is they needed a hotter cathode to allow adequate emission, hence the higher current.

Hi Tim,

I agree wholeheartedly with Steve's comments re. the immediate incorporation of 160-meters into the 1929 QSO Party...

If you'll think back to when the 40-meter band was included, the timing was oh-so-very-rapid that more than a few us were taken aback---in fact, there was considerable debate as to how the scoring would take place, right into the actual time of the first weekend!

As for "...needing time to build equipment (for the band)", I'm with Steve again here: what's there to incorporate Top Band on a HB rig...? Simply take the "L" & the "C" used on 80-meters, and multiply by two! It's that simple...

I think the addition of 160-meters is a great idea, & I eagerly look forward to getting on the band & making some QSOs! I only wish that I was made aware of the background history of this notion...was it something that came-up at on the occasion of the most recent AWA conference...?

The first weekend will coincide with the ARRL 160 contest. It may be premature to bring it up for discussion, but I would hope that we would avoid the contest activity typically wall-to-wall 1.800 to 1.875. There is commonly some SSB activity dispersed throughout the remainder of the band. We might shoot for the high end around 1.980 .

I've worked many QRP stations on the east coast on 160m, so no one should think this is impossible.

Yes I just checked the dates and the second weekend is clear. As you indicate Steve, we would probably not want to be down in the normal CW section anyway and that a better spot would be higher in the band above 1.900...better prop up there as well.

Steve

Hi Steve,

OUCH...!!!

Yes---I'd COMPLETELY forgotten about the ARRL 160-meter CW contest that weekend! It'd be fruitless to even try to be heard above the QRM that that event generates...

The only other thing worth consideration (maybe) is this: since the '29 affair started out on 80-meters way-back-when, keep it open for that band on BOTH weekends---but on the weekend of the ARRL fray, allow operations on 80-meters AND/OR 40-meters---in the weekend after the contest, allow operations on 80-meters AND/OR 160-meters...

Kinda confusing, I guess, but it'd allow relatively interference-free operations on fully three bands, sorta-kinda...

Let the flaming begin...! : >)

I realize as a new guy I shouldn't even be commenting, but...

The Bruce Kelly being partly concurrent with ARRL 160 creates somewhat of a dilemma for me. I have a long history of operating ARRL 160. Oops! My secret is out. I will likely be on for only half of the Bruce Kelly.

I do plan to make 160m coils for my TNT. Low power will definitely work there. I've worked most states and 58 countries with less than 5 watts on that band. However, I'd prefer to see operations there in the lower 10 to 20 kHz. There is little to no DX below 1810 and usually some space down there except on major contest weekends. It remains to be seen whether one grid coil will cover the entire band, and I'd rather not wind two of 'em.

Just my personal thoughts...

73,
Paul N1BUG

No flames from here, Eddy; I think that's an excellent suggestion.

Somehow I missed the original post on this subject - it never made it to my inbox, nor is it in my spam folder.

Who is the AWA "official" that actually sets the rules - is it still Tim W1GIG? WHoever it is, are they "in the loop?"

I have 160M coils for my PP TNT already, although it's been years since I used it on that band.

Just thinking out loud, I wonder if 160M contacts should count more than 80M or 40M contacts, as in Linc Cundall, to encourage 160M activity? Or should it be kept simple, like it is now?

Hi Steve,

When did the idea of incorporating 160-meters into the 1929 QSO party even originate...? And why did that notion ever come up in the first place...?

All I ever saw referencing this potential change was your note on the Reflector, briefly mentioning it almost in passing. Was there a string of other posts in this forum that I'd missed somehow...?

I would think that a public posting such as yours would have served as a sign to others that a public, open-doors discussion on the idea was/is, indeed, most appropriate at this time: otherwise, why would you alone be privy to express your opinion on the matter...? Are there not scores of others who regularly participate in the 1929 QSO Party who might have a stake in its direction, as well...?

Now THAT would strike me as hardly being appropriate at all...

Sorry, just my $0.02!

Hi Larry,

My suggestion of using an "extra" 40-meters, and an "extra" 160-meters on separate weekends has a fatal flaw...

On the 80-/40-meters weekend, one would be blessed with a round-the-clock Saturday & Sunday of activity, which is great! However, on the 80-/160-meters weekend, we'd be right back to it all being strictly a "dusk to dawn" affair, because of the similar propagation habits of those two latter bands...

As you say, maybe there'd have to be some sorta extra points incentive to tempt participants into adding extra "L" for Topband...? Otherwise, I think participation there would be quite low ("I need more copper tubing, Scotty! More copper tubing!" - "Buh Captain! I'm given yuh all of the coil tha' ah have now!" - "I'm a DOCTOR, Jim, NOT a copper miner!"- "FASCINATING!"). : >)

When did the idea of incorporating 160-meters into the 1929 QSO party even originate...?

GM Eddy & all,

It originated at this Conventions Ham Ops meeting. I asked Tim if anything "new or radical" came out of that meeting. The 160 proposal was the answer and that it would be introduced in '12.

Thinking it a Grand Idea I urged for opening up 160 this year.

Tim, Scott, we need to hear from you on this.

I agree the 160M addition is a good idea from my side too. However, to rush this into the 2011 Party might not be advisable. As I'm seeing there may be road blocks to it's inclusion and as a result might even result in movement of the QSO Party weekends due to conflicting 160M contests (ARRL 160M Contest). So what may be a great idea to further the popularity of the event might back fire if it is not opened to more people to discuss. My impression would be that if it comes up at the AWA convention ham forum then Tim W1GIG (our AWA Amateur Activites man-in-charge) would then take it to the manager or coordinator of the particular activity (Scott WA9WFA in this case). Thus, not to overload Tim with additional duties, Scott would be responsible to hit the various reflectors and direct contacts to past participants to obtain and report comments. Based on that gathering of information a sound discission could be made on how, or if, to implement 160M operations into the BK QSO Party.

Remember we also have a deadline to publish rule changes into the AWA Journal well in advance of the event. Not doing so puts those without internet access at a major disadvantage. Yes they do exist! My guess is the next issue of the journal would be the one with the announcement (October ??). So as good as the idea might be I'd prefer we all take a step back, breath-in and realize that there is an official hierarchy to all of this. The first I saw of this topic was the message Eddy posted to the AWAGROUP reflector on the 2nd (Thanks Eddy) and I noticed the BK event manager was not CC'ed on that email. So perhaps the guy who sends you the logs sheets in advance, tallies the results and does the write up for the Journal was not even privy to the discussions about the 160M addition. To be honest, I'm not even sure there is a "duties" or responsibility document written for what event coordinators or managers do within the AWA. I hope there is - as to accept such a responsibility without any guideline is asking for trouble.

So let's slow down. A good idea can become a great idea if the time is taken to properly implement it.

Just my cheap thoughts es 73

I think here in TGWN we had ham license plates in the 20s. I did a bunch of research before my Ham radio vintage display at the museum. I was surprised at how early radio was organized here but then I also wasnt. Many radio pioneerswere born here and many did their work here. I have a piece I wrote from my research. It was my museum handout.

Louis, I opened my DX40 today. Pretty typical for the period..a couple 40mfd filters and some ceramic discs and so on. I note that it has an antenna tuning control. Will I still benefit from my Heathkit AC-1?

Best/73,

From: whitebear1122@comcast.net
Topic: 3468 Message: 3478

Hi all, Yep I'm back. I think I unsubscribed in the Spring when I unsubscribed from nearly all BA. I had some lists coming to my work email, some to my whitebear1122 email, some home. I had too many posts and wasn't able to keep up with them. Layoffs at work were coming up so I unsubscribed from most to try and consolidate to one non-work address.

ALL of my January through July radio'n has been selling radios. I've sold maybe 50-60 radios, Ebaying most, some local or within a couple hundred miles for the heavy 32V-2, 32V-3, 75A-1, boxing, shipping, scrounging shipping materials from work, I hate the whole process. It was alot more fun acquiring radios than selling them. I've sold more than 1/2 of my radios by now. I stopped selling in August for a break, and now I'm in this remodeling project.

I've still got maybe 10-15 more radios to sell this fall. You really find out just how much stuff you have when you move the shack. Holy moly. Examples include a Ten Tec Corsair and ps in original boxes, minty Hallicrafters SX-115, Ranger 1, (4) SW-3's, 4 or 5 1960's shortwaves, a Lysco 600 transmaster, Hammarlund HXL-ONE amplifier, Heathkit tube grid dip oscillator with all the coils, a Micamold XTR-1 transmitter assembled, a Micamold XTR-1 kit in the original box, couple pieces of test equipment, Johnson Kilowatt matchbox, a homemade (by someone else) bazillion watt antenna tuner - gads at least 3 kw for sure, Heath SA2040 antenna tuner, and some others that I don't recall at the moment. Even the remaining list overwhelms me. That will take a bunch of time to sell, box, ship.

I'm just starting to remodel the walkout basement and my shack. The shack is completely disassembled, all radios are stored in the back room, all operating benches are disassembled, all wall shelves down and in the garage, and the ceiling was just torn down today. Only the Gross CP100 remains sitting on the desk because I have to take it apart in order to move it into storage. I'm still boxing up the radio work bench.

So that's why I haven't been around much. I did buy a Millen 90711 vfo for the Gross CP-100 transmitter. I'm hoping to restore it before the Linc Cundall. 73, Scott WA9WFA

Hi Scott,

Excuse me?
For a moment I thought I read that you were selling radios without conferring with your best friend in Maine....I must have been wrong.

At least you kept the Gross rig, that's the coolest one, add my name to the top of the roll call when/if that goes on the block.

Any 1930/40s stuff for the 1UJR shack?

I feel your pain, plenty of later gear to unload here, and man you're right on point, far easier to get it into the house than get it out! Most new hams have zero I interest in anything without at least a LCD display. Enjoy the process, and remember your good friend in Maine. He's charming, dashing, pithy, and quick with PayPal - or what ever other mode of exchange you're accepting.:-)

Cordially,
Bruce J. Howes W1UJR

Paul - I totaly agree with Bruce and see nothing to apologize for! I too would prefer to see any 160m AWA activity on the low end as that portion of the band has been set aside for casual CW work and traditionally, it is closer to the original 1750kc band of the 30's.

Anyone winding 160 coils for some Transcon work?

Let me go to the archives and make sure I read all the posts from last week regarding this option.

I didn't know anything about 160 meters rule change for 2012 being approved at the AWA Amateur Forum until Lou CC'd me on an email exchange with others. Same as last year, I didn't know that the AWA Amateur Forum approved counting modern stations in the 29 QSO Party either. I only heard about it after I submitted my 1929 QSO Party article. Marc Ellis informed me of the new rule and told me he changed the article to add it. Obviously had I been able to attend the Forum I would have been in the know. Sure wish the Conference wasn't so darn far away.

I think adding 160m is great and I support it. No I don't have a 160m antenna and not sure I have the room for it but I can try. As far as the implementation date discussion, it sounds like the start date has already been set to 2012 as decided at the Forum. I'm just coming up to speed so give me a chance to ask around for opinions on starting it this year.

I can't believe summers pretty much over and Fall is approaching. 73 Scott WA9WFA

Hi Mike,

Your correct they may not contribute input, but don't you need to join the group to have access to pictures, files and archives? (Probably moderator selectable) Some may not have the time to do the daily readings, but may come and visit from time-to-time to read email archives or just see whats new.

I'd vote to leave them. Can you see a list of those who just stop by to look via the web? Nothing is worse than signing up and then later forgetting your id and password. I had a few on Yahoo like that and man was it a great deal of work getting myself removed. I've learned my lesson and now use a fixed ID and password for all my Yahoo group work.

I suppose however if you do remove them, it's not the end of the world, and they could always subscribe again if they are just a periodic visitor. I guess if I would have subscribed to a group, and rarely visited, I'd probably forget that I even subscribed in the first place, hi.

BTW, I do kind of like a few of the reflectors I'm subscribed to that send a monthly email reminding me I'm a member. In a way that kind of helps to clean up the subscription list. Not sure if the Yahoo Groups has such a feature though.

Once you're signed on you can go to "My Groups" and see a list of all the groups you belong to. Then you can click on which ever one has the latest activity. Of course, you'll only see the ones that are signed onto with your current password. I don't know about the email part but if I don't contribute anything, it's because I don't have anything interesting to say. But I learn a lot from what others say.

Hi Mike and other members,

Woody here.....I live in northern Idaho (out in the booneys). First of all I'd like to say thanks for allowing me to join the group. After a while I do hope to contribute more to the group than I take from it. I've been retired a couple of years now and have gotten into old radios for a hobby. I'm mainly interested in pre 1930s TRFs/Regens battery powered. I know some basic electronics but know very little about these radios. I'm on the net a lot reading all that I can find about them and I am a fast learner. I already have a set that I would like to restore or recondition if I can't find the vintage parts to keep it original. Again thanks again for allowing me to join and anyone feel free to contact me as I have all the time in the world and I will post again soon.

Thanks Scott - I think Lou and some of us will try and talk this up so that there will be a few QSO's on 160 on the second weekend and provide you with some new input for the results 'column' ...leaving the 80m watering-hole on weekend number one is just not going to happen! I mentioned to Lou that I thought what the AWA needs is a '160 '29'rs Night' some weekend or perhaps our own Yahoo Group could get one started. Like anything new, it would take a few rounds before it caught on..... I think....or....maybe we are all just flogging a dead horse re this 160 thing as it really does cry out for it's own weekend.

I appreciate any effort that you can make to get the new 40m window (~7110-7120 +/-) published for the upcoming Party as it would sure help us to get away from the RTTY guys who seems to be contesting there every single weekend now....if the higher-powers insist on leaving the old window in place as well, then perhaps it could be designated as the 'secondary' window and the new one as 'primary'...my this is all becoming too complicated for such a delightful little affair ;-)

Hi Steve, just my two cents worth:

"this is all becoming too complicated for
such a delightful little affair ;-)"-------Yep. Lets keep the Bruce Kelley as is...80 & 40m. Moving the 40 m window up above 7.1 mc might be an idea worth trying...the QRM is ruff around 7050 kc, but having two windows may be a bit cumbersome. There aren't that many of us in the party so spreading us out may not be a good idea.

 "what the AWA needs is a '160 '29'rs Night' some weekend or perhaps
our own Yahoo Group could get one started."-------GREAT idea. I hope this works.

Steve, you are right...this is a 'delightful little affair' and seems to me that adding more 'options' will make it more complex...plus making the playing field a bit more uneven.

However, I'm looking forward to the event in most any form. I get my thrills from making the contacts, not my score..hi.

Subject: [AWA Group] Re: 160M in 1929 QSO Party

> I think adding 160m is great and I support it.
>I'm just coming up to speed so give me a chance to ask around for opinions on starting it this year.

Thanks Scott - I think Lou and some of us will try and talk this up so that
there will be a few QSO's on 160 on the second weekend and provide you with
some new input for the results 'column' ...leaving the 80m watering-hole on
weekend number one is just not going to happen! I mentioned to Lou that I
thought what the AWA needs is a '160 '29'rs Night' some weekend or perhaps
our own Yahoo Group could get one started. Like anything new, it would take
a few rounds before it caught on..... I think....or....maybe we are all just
flogging a dead horse re this 160 thing as it really does cry out for it's
own weekend.

I appreciate any effort that you can make to get the new 40m window
(~7110-7120 +/-) published for the upcoming Party as it would sure help us
to get away from the RTTY guys who seems to be contesting there every single
weekend now....if the higher-powers insist on leaving the old window in
place as well, then perhaps it could be designated as the 'secondary' window
and the new one as 'primary'...my this is all becoming too complicated for
such a delightful little affair ;-)

I dont understand all this I guess. You have a 160 rig? Say where and when you will be on a plug it in and pound some brass. There are 365 days in a year . All are condusive to Ham radio ops. Even 160 M. This once a year idea escapes me totally. I understand operating on the special day to commemorate Bruce Kelly and his dedication to the hobby but you can fire up and be on tonite if you wish. All you need are two willing operators.

Scott (WA9FA) has said:

Steve, I think your ideas of a 160m 29'er night or weekend is vy good indeed. Then the 160m 29'er QSO Party date could be scheduled away from any 160m contests. Contests are tough to schedule around. There is a RTTY contest nearly every weekend, 1 or 2 cw contests every weekend, on 80m and 40m.

Why don't you take that idea and try it out. I don't have a 160m antenna up yet but I'd try to just to work this event.

Even the Linc Cundall in January has quite a large 1929 contingent in the midwest even though the event is really geared towards more modern 30-40's gear.

****

The concept of having our own 'Yahoo Group 160m Party' is generating some interest. I think we might have an opportunity here to do something really interesting. One advantage of doing this would be the ability to schedule it during a mid-winter, none contest weekend on 160. As well, can we discuss the idea of perhaps advancing the 'year of criteria' by just a few to allow the use of some more readily availabe and cheaper tubes. Let me suggest 1936 or earlier for sake of discussion. Those nice 46's and 47's (and a host of other 'new' tubes crying out for a project) may have just found a new future. As well, do we really need to restrict ourselves to 10W?...how about no restrictions or at least, one of higher power, thus allowing the use of P-P MOPAs in the 50W or more range. With the poor antenna efficiency for many (80m dipoles pressed into top-loaded T's?) being able to run more than 10W on topband would surely help. Since crystals and eco's / vfo's were beginning to show up around then, why not allow these as well?

Just some things to further discussion...or am I all off base here?

true but I think the idea is to get more than two on at a time as well as give those that do not presently have anything for 160 in the vintage style, some incentive to melt solder!

Well I would have no trouble with more than two but you need at least two. If the rigs were used regularily(ie weekly or even monthly) I suspect solder sales in North America would increase. Until race season hit I used my 80 M 1930s style station almost very night. After 2nd weekend in Oct I will be back at it as much as possible.

Popular management theory hold that one should not make a suggestion, unless they are personally prepared to implement it, but in this case I have neither the experience nor the skill to do so, but nevertheless allow me to make the suggestion.

I've been involved and member of AWA since the mid 1990s, and was fortunate to meet and be given a tour by Bruce Kelly himself. Most of us know Bruce or know about Bruce, but as I read my early copies of the AWA Review I come across author names that are clearly important, yet I know very little about. Reading the articles is immediately apparent that these folks had a most interesting past, yet I've struggled to find little about them. Names like Brelsford, Williams, Matlack (from whose namesake I have been presented with an award), Morris Moreau, Dowd, etc.

Does there now exist, other than in the brief bios in the Review, a collection of the founding lights and early forerunners of our fine organization? A sort of "Great Men and Women of the AWA"? I would find, as I would suspect others, such a tome great reading.

Consider this a modest suggestion or question. If I can be directly to such a publication, I would be most grateful.
If, on the other hand, one does not exist, does the general membership see value in such a book? Call it what you will, "The Early Days of the AWA", "Great Men and Women", the important thing is that some remembrance be there.

3511. Screen grid modulated TX

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-09-13 02:27:21 UTC
From: Don
Topic: 3511 Message: 3511

I am back playing. I reviewed my Powerhouse Rx after purchasing a new digital meter which includes cap and R . Being severely colour blind I often mess up resistors. I finally gave up reading colours and now measure them all. Discovered I had really messed up the cathode reistor . I fixed that and changed a coupling cap to a slightly higher valve and the set came alive. It has been runnng now for several hours beside me. With the reciever now working properly I turned my attention to the Am transmitter. The oscillator is working.It tracks slight off from the rx but not much. Certainly correctable. I tested it for sure by removing the rx 's coil so i know only the Tx osc is working. Power output though is tiny. The Pa (50l6)is not pumping up the signal. Voltages seem fine. I expected some carrier output even in AM mode with no modulation. Screen voltage which is adjustable ranges from 56 to 70 volts (no signal) with plate at 154 volts. Control grid is biased at -4. I suspect I am missing something or have made a "hidden to me" wiring error. Tommorrow I will investgate further. First to see if the modulator section of the 12sl7 is working properly. I am thinking a pair of earphones should tell me if the little amp is amplifying. Initial voltages seem good. I wondered about the tank circuit but the oscilator has enuf range it should be in freq at some point. I have it on my dummy load (11 watt 110 volt light bulb that I use for all my low power tx s.) I can see this will be a experience to remember but I will give it my best. I built the tx from Bob Weavers Am broadcaster circuit but subbed the 12sl7 and the 50l6 tubes for his compactron. I was thinking or expecting a couple of watts at least even at 154 volts on the PA plate. If it worked I was going to whip in a doubler circiut to boost power. I am out here where I have never been and am a bit nervous and not totally sure where to start looking for the trouble but I gotta try. I am not sure why when the osc is working and the tube reasonably biased why there isnt some carrier output . I am all ears to any screen grid modulation experts.

Hi Don, Can you pass along the circuit?

A 50L6 as a screen-modulated class C amp is going to be very low output, probably around 0.5W best-case.

These "phono oscillator" circuits, if that's what it is, put out very low power, typically less than 100mW.

BTW, I came across a 50C6 for $1 at a hamfest last Sat. but passed on it, as I didn't think I'd ever put it to use. Had never seen one before, but I remembered you speaking highly of them. I did buy a 1J6 (= type 19 dual-triode w/ octal base), a NIB 1612, and a 7894 (appears NIB) all for $1 each.

Can you help me understand why. I get huge power from mu y 50l6 tx so i had thoyght I should get reasonable output even in am mode.
>
> These "phono oscillator" circuits, if that's what it is, put out very low
> power, typically less than 100mW.
I understood that but figiured with the upgrade in tubes power should be up since the basic circuity is similar to my 50l6 rig except the 50l6 is now a PA and I have a seperate osc. I have this idea nad it may be wrong that even a phono oscillator circuit built with an 813 for instance and corresponding power supply would have at least a lot more power than the original phono oscilator circiut. I also need to have CW mode in this tx but I think that will be ok to do once I get the osc actually driving the PA tube properly. I know this is all silly but it is how I learn. Thanks for helping.
>
> BTW, I came across a 50C6 for $1 at a hamfest last Sat. but passed on it,
50C6 is a very stout tube. biggest dettraction is very slow on warm up. . probaly over 2 minutes but when it ison duty it is a good tube. mre output in Rf and runs cleanerfor some reason. I am happy with it in the single tube tx. Moved all my 50l6s to this project.

3514. Screen grid

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-09-13 17:50:54 UTC
From: Don
Topic: 3514 Message: 3514

I am making progress I got the modulator scetion working well. Screen voltage is variable within what I believe is the rght range , Amp section is working. i tested itwith my earphonestracing it from Audio transformer through caps to the grid of mod-section of 12sl7 out the plate to the neon bulb, through the bulb to the pot and down to the screen connection. I can set the sceen adjustment (modulation control to me) so i get no light and all modulation is visable on the bulb as I talk. At about 1/3 (tiny light at no audio gives full brightness in a normal speaking voice.) peaks and valleys are clearly visable. Now I have to figure out why I have no amlified Rf . I think I know but I have had enough for today. I also got my last carbon mic I showed you (the big one) to operate properly in this circuit. Press to talk works well with it.

From: Don
Topic: 3515 Message: 3515

I have narrowed it down to a weak oscillator in the tx. It is just running and not all the time. I may have to redsgn. Terhaps i included too much from the original colpitt circuit. I will build it as the rx without the regn control and see what happens. I tried boosting the Plate volts to 150 but it made no dicernable difference. It just isnt happy I guess. When i had it working I had a Grundig portable on freq sitting right close. When i heard the Osc balnk the grundig as it tuned in I keyed the mic and spoke. it actually worked very well. Then as quickly as it started working it quit again. may be someithing intermittent. Anyway I need a lot more rf coming to the control grid of the 50l6 than I have right now. Gotta be away to get this thing to the next stage. Tomorrow!

>
>I found an interitent connection in the osc stage>
I could hear it when rocking the plug in coil back and forth. Eventually itstartedworking. It was funny because at one point the set was actually listening to itself. It is time to install a transmit rec switch to switch B + from one osc to the other. The rec uses asepreate antena. this is because I have learned over the years thata tuned antena on a regen often gives dead spots while arandome length often does not. I now have the two osc almost on top of each other so may be able to get it right on when the final polish comes. I will install a RIT cap in the rec circuit I think. Then I can correct any minor mis tracking and also have some fine rec tuning. I need to find out now why I dont have more rf output in the PA. I have a 151 pf coupling the osc plate to the 50L6 control grid. Perhaps that isnt enuf. The 50L6 is a purple gas tube (All i get from this one manufacturer are.) When speaking you can see the modulation in the tube as the gas turns purple with your words. If I turn the screen control aka modulation control up full it also goes purple. I am thinking I should have full carrier avaialable at that point or close. If that is so I can cathode key it and have CW as well. I have come to like cathode keying. Never messes up. Very definate. Key is at ground potential.
Any sugestions on how to get this rf up? I should be able to get 2 watts I believe at least at this vltage with this tube at full modulation. So far I can get it to work but havent got the power where it should be. I doesnt even bump the meter. My other 50l6 tx produces8 to 10 watts on the meter but it is a 300 volts. I am at half that here but it is the tubes full rating so I should get at least 2watts I think. Any ideas? I know my other 50L6 rig will run almost the same with no screen grid connection so I know that not having the screen at plate potential is not the problem. I think. ? I wish I couldaplly this modulation style to me 50L6 80 meter rig because i know it has the RF power. Sorry to go on about this. Maybe I said too much already.

I got it!
I made the osc circuit almost the same as the rec osc and it wrks. basiscally I changeda plate to ground cap to the same value as therec osc and away she went. Power is a HUGE 1/4 watt. Mid range on modulation control gives best modulation. Full gives almost none but full carrier power so I can use that for Cw mode. It is really funny because right now the rec section listens to the tx nicley. They track close enuf. You have to watch you dont get to close to therec spaeker though or you ge tfeedback even with small volume on recr. I need to rework the modulation control sightly as carrier disappears at full low and I think it should always be there a bit. I may play more with the osc circuit to see if I cant get a bit more out of it. I see that I really need to consider a PA for this rig and just keep it as an exciter. The balance between audio and rf from osc is the trick to its operation. to much of one kills the other i think. Since it is good I think a 50C6 (I have a spare) at 300 volts as a Stand alone PA would give me maybe 10 watts at best . That would be enuf. Anyway I have a AM transmitter soon to have CW as well and rec all in the same box with common filment and B+ supply. 2 12sl7s and 2 50l6s
Life is good here on the ridge ;>). Here it is with all the test connections and jumper wres hanging about.

I worked on it today for awhile. I tried many many things to boost power. Including playing with screen voltage etc. I know if I double the final's voltage which I can easily do i willl get more but how much more? Probably not enuf to suit me. Since i am using the one section of the 12sl7 as a osc and feeding that to the control grid (biased at -5) I have come to the conclusion the 12sl7 osc does not drive the tube hard enuf to make the 50L6 perform at max. Feel free to jump in here anytime if I am off track. I am learning as I go. I tried many things today. Different grid leak both r and c (Difference was negligable.) I played with osc plate voltage. If raised too much osc quits. I tried raising and lowering cap coupling from osc plate to final grid . In each case where I was worked as good as any. I built the osc same as the rec osc detctor was(grid ,cathode centre tap and ground) but put it in permanent oscillation. I did this because the rec oscillated nicley at just over best signal so it was easy to get the same condition in its tx mate. I could build a hartley using coil on the plate but would need a link coupling as well I think. Then i could get more power out of the hartley circuit i think. (??) Then use that to drive the final harder. Basically build a small transmitter hartley style tofrive the final but would the modulator be able to modulate the screen of the 50L6 enuf with the increased power? I dont know. I have reached a plateau and am going to take a break and think this through. If you have been down this road please speak up.
meanwhile the rec is playing away nicely beside me as I type this.

Good afternoon,

I have recently gotten the hots to put my SW-3 back in use. Its been several years since I played with it. I have a few gen. cvg coils and a couple of bandspread coils. One of my questions is to pin-point the date of mfg. It uses two 36 tubes and a 37. The phenolic 37 socket is marked '237'. At the left rear there is a long shafted on/off switch. The antenna/gnd terminals are spring loaded. There is a 4 conductor, cloth covered power cable with a 4 pin male plug. Any idea about the year of mfr and what series coils it should use (I think the 10-20 series, but not sure). Another question is will other series coils work in my model ..such as the series 60-70 and 30-40.

Thanks and 73 de Bill K4JYS

Hello, Bill,

Not sure if this is much use to you, but according to my info, the SW3 was designed in 1929 and, while production may have began in 1930, 1931 is generally given as the first year of manufacture from the sources I could find.

I am interested in your coil question. Coil sets 15A and 65A are also listed as compatible for the SW3 and SW5. And National offered coil forms to 'wind your own' coils.

Here is my coil question: I have recently purchased a McElroy MT35 transmitter for restoration. The coils and crystals are missing. I understand WRL purchased this design and marketed it as the Globe Trotter. Would anyone in the group have experience with the Globe Trotter coils and crystals? I see there were a number of accessory coil manufacturers at the time. Would any one know of concerns or limitations of using accessory coils or would anyone know where I might purchase a set of original coils?

Very best,
Jim.

Bill -

I'm no SW-3 expert, but the 36-36-37 'Combination AC-DC' version was described in the original
September 1931 QST article.

Going from memory, I think any coil 'can' be used with any model by adjusting the number of tickler
turns, but there are differences. I've attached a CQ article that describes the differences. I
have some other SW-3 information if needed.

Howdy,
    I own two SW-3s and I have both original and Jim Fred forms. In their day they were referred to as "transformers," I guess because of the 3 windings. The major difference between the 3 types of coils is the tickler winding. The earliest ones used color coding in a thin slot on the top edge of the odd, 6-pin forms. The more common ones used a 6x designation hot-stamped into the base of the coil form. I think the Universal types used a 3x designation. I have never seen the Universal type.

    Jim Fred is SK now but his coil forms were paper/cloth based and in my experience I have found that in order to get them to regenerate well, I had to add tickler turns. This may not answer your question but I thought I would pass it along. Good luck on your project.

Gentlemen,
After a year of searching I finally acquired an RME DB-20/CME-50063 pre-amplifier to go with my RME-69. A fellow AWA member offered it to me at a good price.

A problem has cropped up as a result of a previous owners modifications. To wit, they cut all the wires to the In-Out switch and left them dangling in mid-air. Bummer! With the paucity of data on the switch, I was wondering if anyone has access to a DB-20 that might be able to provide a couple of digital photos (the best) or a complete description of the wiring to the switch. I would be obliged. Thanks.

Any coloring in the wires has long since faded. Does the AWA museum have one of these?

Hi Roger,

First tnx for the comments on the SW-3 coils. I have some gen. cvg. coils with the color cod ing and some series 60s too. Now that I have more info, maybe I can get something going.

Did you get the DB-20 info you needed. If not, I have one, its the black wrinkle version. If you think it would have the same wiring as yours, I would be glad to try to get you some pix and maybe chase out a few wires.

Howdy Bill,
I'll gladly share whatever info I have on SW-3s. I have two, type 2s. I got both as basket cases and had restore them from the ground up.
I have both of mine fitted with 6.3 volt tubes. BTW: If you know anyone looking for an SW-3, I'll let one of mine go for a modest price. I have to thin the "herd" a little. :) :)

As yet, no responses to my request for DB-20 data. Mine had been in a building which burned and has a coating of ugliness all over it. On top of a possible power transformer problem someone in the dark past cut all the leads for the In/Out switch. In it's present state there are a set of leads that go direct from the antenna/ground board to one of the aluminum cans in the front of the chassis. The switch is almost an orphan.

I would be overjoyed to get any info on this. Pix? Sketch? Let me know.

Mine is a DB-20/CME-50063 that was apparently made for the Navy in 1942. It has the black, crackle finish also.

I have taken the liberty of attaching a pix of one set-up I have for my vintage station.

Well Roger....looks like I may not be of any help.

I just looked at my DB-20 for the first time since I got it. It, along with a RME-69 and the LF converter have been on the 'round-to-it' shelf since I got them as a package several years ago. My DB-20 seems to be different than yours. On the left I have a non-toggle on-off switch (H & H mfr, so I think its orig). On the right I have a pot (Allen-Bradley, so that's a sub...center term to gnd, another term to a wire going under the tube sub chassis looks like...probably the gain pot). And of course the band switch is in the middle. On the right rear is a female 4 cond. socket, with two wires connected and the antenna terminals are on the left rear. I see no 'in/out' switch, which does appear on the BAMA info, which makes me think I may have an earlier model than yours. I'm sure you have looked at the BAMA/Riders info...several schematics of 'late' models are there and show a 'in/out' switch.

Tnx for the pix of your beautiful, first class, vintage station. Makes me want to get back on a 20's project. Sorry I couldn't help...good luck with that project and tnx agn for the SW-3 info ...73, Bill K4JYS

I've just been asked to give a short talk about late-1920s ham radio at a local club meeting next Monday! I will be immediately following a presentation on spark gear and early receivers.

I'm really pressed for time these days and could not quickly locate definitive answers to a couple of points I wanted to bring up. If anyone can help me out, I would appreciate it.

Questions:

When did spark largely give way to CW / tube transmitters?

IIRC the late 1920s initiative to improve the quality of signals on our bands was driven by the ARRL and the amateur community (and not by Federal Radio Commission mandate). Is that correct?

I would appreciate any help I can get on these points. I think I'm OK on the rest of my "facts".

Hello Paul,
To answer your question about when spark largely gave way to CW, I'd have to throw my two cents in and say the early 1920's. With the beginning of restored Amateur priviledges in 1919, experimenters were starting to see the obvious advantages over continuous wave transmissions over spark. The biggest problem at the time though was the vacuum tube patent wars between DeForest and others. Unless you really had either clout, lots of money, or both; suitable vacuum tubes were pretty hard to obtain right after WWI until about 1921.

Rotary gap transmitters were all the rage, but it wasn't until the ARRL and others who experimented with CW type transmitters demonstrated CW's vast superiority. Shortly thereafter when the Trans-Atlantic tests began, the high powered stations involved in it used CW due to it's vast superiority over damped waves.

After the Transatlantic tests there was a push to abandon spark type emissions for the continued use of CW due to the (although still expensive) availability of vacuum tubes, crowded bandwidth and the infancy of the new medium of commercial broadcasting. QRM to the then assigned wavelengths was bad enough with CW transmitters, but with spark it was even worse!

I'll be interested to see what others say about this topic as well.

Very best regards,
Joe Cro N3IBX

Hi Joe,

Thanks for the input! I appreciate it.

I would have guessed early to mid 1920s but am not too familiar with that time period yet. I only started cultivating my interest in antique radio less than a year ago, and have been concentrating on the late 1920s period. I wish now I had done more reading on earlier times... or that I had more time to prepare for this presentation.

I will be taking my completed but not yet polished TNT rig to show.

Gentlemen,
I agree with Joe Cro's assessment of the cause of King Spark's demise. One additional facet of the discussion is the immense bandwidth
required by spark. I'm sure it measured in the Megacycles. The efficiency had to be lousy what with all the heat and light generated. One just has to see the Clapp-Eastham KW in action at the AWA museum to get visible proof of that.

Still, there is something soul-stirring about the thunder and lightening that thing generates (not to mention the crisp smell of Ozone).

CUL, Roger/K1TG

Paul,

I'm fairly certain that there were "new 1929 regulations" imposed by the FCC with higher standards for amateur signals, which in turn drove the ARRL to encourage amateurs to get a head-start on meeting them.

It is my impression that amateurs were already pushing the envelope. and by 1929 you would have a hard time finding a spark transmitter anywhere. (or a crystal set ham receiver.) There is often an assumption the development is driven by "The Professionals. " or by Government. However when the facts are investigated one finds amatuer experimenters way out on the curve trying new things and trying to get more out of less. It is so in almost every area of life I have been active in. I have one book written during the spark transmitter era. It is pre WW1 by a few years. I have a couple of issues of 1927 radio magazine here. The big thing was electrifcation and taking your set off batteries to Lamp socket power. There are several articles on how to improve your signal from your tx and eliminate unwanted radiation or interference. There is not one single thing in either of them about spark transmitters so they were obviously long gone way before this time , early 1927. Tis also highly unlikely (now or back then) that a government agency would be on the leading edge of anything. From what searching I did about local ham radio for my museum presentation I would say that by 1919/1920 tubes were in. Spark was on the way out for most. That was the impression I got. I have some 1927 books and I believe somewhwere a 1926. Some one must have earlier ones.

Back in the '70's when I was working for a marine electrical company, I remember seeing a spark transmitter on one of the merchant ships I was working on. I don't know if it was ever used, but it could splatter enough bandwidth to be heard easily in case of an SOS.

Don, my research is similar to yours. I agree with your findings. As for literature, for your interest, I have a copy of a little book by the International Correspondence Schools, Scranton, PA., entitled "Radio Handbook, a handbook of reference for those interested in the radio art", 1924. It is signed by an RCAF F/Sgt. The book covers a number of items from telegraphs, to autodynes, to spark gap. Interestingly, Armstrong's introduction of the heterodyne principle to radio, in 1919 or thereabouts, was not suitable to spark transmission and, as you say, spark likely was replaced by the then modern technology pretty quick, especially as superheterodyne radios required far fewer parts than other receivers of the time and performed far better. You might be interested in this website: http://antiqueradios.com/superhet/ Best, Jim.

From: N1BUG
Topic: 3550 Message: 3550

Look out... that darn BUG is back! A little sooner than planned.

It took being asked to show the rig and talk about late 1920s ham radio to jolt me into completing the TNT. I can't stop on other work yet so I'm putting in a few hours late at night on the TNT after 12-15 hour work days. Had to take today off for medical reasons.

It took lots of advice from members of this group and four attempts, but I finally got the meter painted so it looks decent! I'm now working on restoring the grid resistor and it should be finished (except for the paper label) by Monday.

I even broke down and blew some $$ on a UX-210, though I'm not entirely sure it is a genuine pre-1930 tube. It's close anyway, I guess. I'm scratching my head wondering how I'm going to come up with 7.5VAC for the filament. Hmm.

The only detail yet to be worked out is connecting the free end of the antenna coil to one of the antenna binding posts. It appears the "authentic" method is to use one of those 1920s style copper alligator clips, which I've not been able to find yet. Is the clip necessary, other than for sake of authenticity? I will be using a series variable condenser and don't see why I would need to change the tap point on the coil. Am I wrong?

12.6 VAC or 10V AC xfmr with a variac on the primary (and voltmeter on the secondary!) is one way, if you can't get a genuine 7.5 VAC filament transformer (for the latter, try Playthings of the Past - he might have one*).

You can get by without the clip. Find the sweet spot (which isn't that critical anyway) with whatever temporary lash-up works for you, then solder your lead there.

* no connection, etc. I have heard that he is very particular about following his directions for ordering on his web page, though.

Yeah, I've got a big variac I use for testing old stuff and must have something around for a 12v transformer (if I can find it). That will do temporarily. The 7.5v transformer Lou pointed out went for a bit more than I was prepared to spend this month.

I really need to get in touch with Gary at Play Things of Past and see if I can put a power supply together. I ordered from him twice last winter so I know the routine. I also need a proper/better plate supply now that I have a UX-210 on the way.

> You can get by without the clip. Find the sweet spot (which isn't that

It looks as though I will use a clip, but for sake of discussion (and my education) I'm curious about this. Is there still a sweet spot if one is using a variable condenser in series with the coil? My admittedly brief experiments a few months ago did not reveal any difference in obtainable power output or signal quality for a given output when changing the tap point. Obviously the optimum setting of the series C did change considerably when the tap was moved, as did optimum coupling between the antenna coil and tank coil. With so many variables involved, I very well may have missed something in my tests.

Thanks Leonard,

It's been so long I had forgotten that technique. Many moons ago I
used a 12v winding in series with the primary of a plate transformer
to boost the output voltage 10 per cent. It worked great.

Best regards,
Paul

Using your 6.3 filment transformer build a dc supply all nicely filtered and quiet for a better cleaner signal. if all goes well 7.68 volts approx which under load should be right there. Minor variations can be easily dealt with although many older tubes are very tolerant. They had to be. Even now, today. I run between 115 to 123 volts line Ac here at the end of my rural powerline so sme toerance was always built in. .

Ah. I hadn't thought about running the filament on DC with the old AC tubes. I know you can do it with "modern" tubes as I once built a series of VHF/UHF high power amplifiers using metal ceramic tubes with a regulated DC filament supply. Although highly unusual it worked fine. That could be another temporary (and quick) option since I have the 0-15VDC 5A variable supply I used for testing with the UX-201A and G-71-A tubes.

In the long run I still wish/hope to build a supply as close to 1929 style as possible, but that may be a long way down the road.

That brings up a stupid question which I tried to research several months ago but never did find an answer. Can the old DC tubes (eg. UX-201A) be run with AC on the filament? I don't know why one would want to do that, but curious minds want to know.

> I have tried it. I was never really happy with it but it was usable. You use a pait of 01 caps accross the heater and it does get down to usable but nothing and I do mean nothing works as good as batteries. I have 10 12volts here in series and I charge them by pluging in a power cord with a diode in it. Charge takes about 1 hour. They last a long time. I plsit of a set of filment supplies which I rigged up by ising 3 4 voltsfor the last 12 volt. On a regen and a 01 tx TNT it works great. I now have my 6sl7 regen on it too. I used gel bateries I found at the surplus store for 9.95 each. so cost is in total box and all under $100. The filment sectionis the only one that runs down and I may rig it with a seperate charger.
Watts avaialble for input farexceeds what I have avaiable. if you want it period correct motorcycle batteries can also be used. I used to run my regen on a 6 volt pone for several years.
I also run my seton a poratble vibrator supply salvaged from an old car radio. Vibrator supplies are very quiet compared to normal ac 60 cycle supplies. Sometimes the transformers are a wee bit light for heavy work but a normal transformer can be subbed in I am told. But for a 1 tube deal it is no problem since it was designed to run 6 or more anyway. Also on CW demand is interittent which cuts a large hole in the over heating factor. A Twelve volt and a old style 20 ohm Rheo would get you your 7.5 volts in a heartbeat. Lots of possiblilties.

AWA Group friends--I am writing my license next Saturday and have assembled most of the pieces for my station. Perhaps you are interested in a photo, which includes a McElroy mt-35, an NC101X, SX25, DX40, and RCAF key and BUD practice oscillator. I am very interested in following your posts and am grateful for my membership in this group. Hope to hear you on the air soon. Best, Jim.

Please post this on the AWAGroup. The guys wud enjoy seeing it....

I would hesitate to call this a transceiver as it is really two seperate units controlled by a single dual gang variable cap. Despite many trys I am not able to get the power above 1/4 watt. I believe this is because I dont have enough output from my oscillator to drive the final hard enough. I used a lightly loaded receiver design. I could change it to a transnmitter design and probably get a watt out of the osc alone BUT everything works so well. It is on frequency with the Rec, the screen grid modulation works properly. The osc is lightly loaded so it runs relatively cool and doesnt drift. I think I am going to add a couple of jacks and then do the cosmetics and button it up. It shall be my exciter. I will build a RF PA for it. Probably a 6L6. I can use this to drive it and have a nice receiver, a Am/cw transmitter all working well. I think I will have enuf drive from this to push the PA. I would like 4 or 5 watts I think. Screen modulation at high power is difficult anyway. I have this working so I am invoking "The Cabbage Rule" (Quit while you're a head!).I think I am becoming addicted to AM.

Depends entirely on the application.

Audio output stage, no problem.

QRP transmitter (osc, PA, or both), no problem.

Detector, no way.

Low level RF or audio stages - possibly.

The detector is a problem because the device isn't operating in a linear mode, and you will get all sorts of mixing products with the 60 Hz filament supply. This is why the type 26 was NEVER used as a detector.

Higher-level circuits are not a problem because the signal voltages are significantly greater than any 60 Hz energy from the filament supply that would add to the signal. With lower-level amplifier stages any 60Hz would be larger wrt the signal, and would be amplified by subsequent stages along with the signal. But the type 26 was used successfully in RF amplifier stages as well as the first audio stage - the Radiola 17 and 18 are examples. There was some hum, but it wasn't too objectionable because the low-frequency response of the audio section and reproducer were so poor.

The 26 was little more than an 01A with an oxide-coated 1.5V filament intended to be lit with AC.

Well, as long as you are able to series-resonate the link with the cap, it will probably work OK over quite a range. There are practical limits - a small fraction of a turn for a link, for example, won't couple well to the tank coil, and would need a huge capacitor to resonate it, besides. Make the coil too large and you'll need a tiny, tiny capacitor to hit resonance, and the Q will be very low.

From: Louis Vermond VA3AWA
Topic: 3569 Message: 3569

VIA: http://uk.groups.yahoo.com/group/eddystone_radio_users/

The second edition of Chris Parry's popular e-book on the restoration of valve communication receivers is now available. This free book covers the restoration of these radios to working condition as well as describing numerous models of such sets. This edition has another 30 pages and is now backed up by over 100 web illustrations linked to the text. Many of the tips and techniques are in fact applicable to valve sets of any type. There would be few collectors who would fail to profit from Chris's work.

Chris, who lives in the UK, worked for many years on design in the radio manufacturing industry and is now an enthusiastic collector who likes to restore sets to their original specification. He is keen to pass on his experiences in order that equipment from the valve era will be preserved in working order.

The 120 pages of book text is in pdf format and can be freely viewed and/or downloaded from http://www.vk2bv.org/radio/ where there is a link to the photo site, but please read the conditions on the web site first.

3570. '29 Party-Getting Ready

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-09-27 23:26:45 UTC
From: Bill Stewart
Topic: 3570 Message: 3570

Good evening all,

My first attempt to operate in the 1929 QSO Party was in 2000 or 2001. I used my first HB '29 osc, a TNT using a '01A at around 2 watts input...and believe it or not, I was able to make almost 20 contacts in my first event. I used the TNT up until a few years ago, when I built a '29 Hartley using a '10. Now that I'm QRO, I have increased the QSO count plus adding 40 meters....and the fun has gone way up too. The first antenna used was the one suggested in the TNT article...a off-center fed Hertz or now known as a Windom. It worked well for all these years. Its about 30 feet high and recently I noticed a leafy limb had grown into the wire...and it is too high for my pole pruner. So I decided to string up another Windom from different trees...a bit higher, maybe 45 feet and dang if that one didn't wind up real close to a limb. But any way, the new Windom is up and operational.

I was on 40 mtrs today trying out the Hartley and new ant. and made a couple of contacts. One in Mass. (got a 553C...the tone really not that bad, but there is some chirp and a smidge of drift...on 80m, its a lot better). Had another QSO with a stn in the NC mtns (I'm just east of Raleigh) and got a strong report from him. Also had a couple of good reports on 80m....sooooo, hopefully, I'm ready for the big event.

I'll probably be using this setup off and on for a while....its just a hoot to use that Hartley, even if it does have a 'unique' note. So hope you '29ers will be getting the rigs ready and join in the fun in Dec.

From: Don
Topic: 3572 Message: 3572

While working on my rx/tx I came up with a deal for a dial marker at night. Real radios should be run in the dark. I used a neon lamp directly above the black dial on the planetary drive. I made a piece of wood 1 3/4 wide over the neon lamp. I cut a slot straight down fom the pocket I made for the neon lamp and glued the wood over the neon lamp. The light shines down through the slot a dull red. I could see it but barely. I then took the dial and with a floresent sharpie bought a michels craft store I pianted each line about 3 times an d rubbed of the excess with a kleenex between. I couldnt buy white florescent here but I found yellow and used it. Now in complete darkness each line jumps as it passes under the slot with the very thin line of light. I like it. I have a camera that tames pics at night so will make a photo later.

Don,

Thanks for the comments on running DC tube filaments on AC. I recall some of your comments from last Spring also, about batteries etc. My curiosity was mostly whether AC would harm the tube or not. I gather it won't. Good to know for sake of experimentation.

Sounds great Bill! I hope to work you soon.

I'm getting ready too. I'm excited! My UX-210 arrived yesterday! The variable power supply I'd planned to light the filament with for initial testing was dead when removed from the shelf. Hmph! I haven't investigated yet. I took a few minutes I could ill afford and checked my stash of transformers today, but nothing helpful. It's no big deal. I will sort this out soon enough.

I'm looking forward to finding out whether my new 80 meter antenna works better than the old one (which was never all that hot). The old one came down in an ice storm shortly before the TNT was ready for initial testing, so I've yet to make a contact with it.

I got the rig polished up and installed the NOS velvet vernier just in time for the club meeting last night. A computer glitch prevented me from playing the audio files, darn it! I tested it three times at home. Perfect every time. But at the meeting, NO WAY. But I did talk about '29 rigs for 20 minutes or so and had lots of questions and interest after the meeting. May have even found a local ham who has some 20's Sangamo micas. I hope he has the (apparently scarce?) values I want for my next '29 build.

Hi Paul,

"...THE BEST LAID PLANS OF MICE & MEN"...in Ham radio-speak, we call it a visit from Mr. "Murphy"!

I, too, have been contemplating my own arsenal in the matter of this year's 1929 chirp-fest. I'm leaning toward something bordering on the "ultra-modern", i.e. my 2x227 MOPA (i.e. with one of the two 227 finals removed) driving my paralleled pair of 245s. That'd give me a Hartley oscillator driving a buffer amplifier, which in turn is driving the final RF power amplifier...

I still have to de-bug my 227 rig, though---it's frequency tends to jump around a KHz, or two, for reasons unknown at this time...

ANYTHING other than a "...wind modulated" self-excited oscillator / transmitter for a change! Yup, "THE ROLLINS ROCKET" 2x203A Colpitts (a.k.a. "The Chirper", "The Warbler", "The Yodeler") will be (hopefully) resting on the shelf this time around...

Hi Paul,

Congrats on getting a real 210...been looking one too, but the prices usually scare me off. But, I'm gonna jump on one anyway. Of course the VT-25 and '10 do the job too, but just doesn't look right. As far as the fil. is concerned, I just use a rheostat and a voltmeter...period correct and simple. I picked up Sangamos from PTOP...at one time he had plenty. Sounds like you are well on the way to a real nice rig. Hope we can work some time and esp. in the '29 Party.

Oh, sorry about your problems at the club meeting. However, s ounds like you still had a very interesting program. Maybe you spurred some interest in a budding 'chirper'.

Hi Don and yes I am having a blast. I'm usually on 40 mtrs in the morning...8AM till 10 or 11, but not on a reg. basis. However, the QRN level is still high here. Its supposed to cool off later in the week so maybe the storm activity will slow down and band condx improve. What time/freq would be good for you. I'd like to know if I can make it into VE3. I have in the past, but never know about condx.

Boy, that's a good idea about the limb cutting. I live in the country so it would be no problem to try that. I built my Hartley a few years ago and it works pretty good. Its very prone to vibrations and during last years '29 party, I put it on a cushion of foam rubber. I still had to clamp the key to the chair arm to hold down the keying vibrations...hi. I live about 30 miles from a AF base and the jets train over my QTH and at times the rumble is loud...thus a quivering tone from the Hartley.

I built a one tube regen several yrs ago...using a 30 and from a 1935 'Radio' mag. After a few beginning problems, I got it working and it works real well...very sensitive. I also have a SW-3 that I need to get on the operating bench. And, I also want to build up one from the late '20s to go with the TNT and Hartley. Plenty to do..not much time to do it..hi.

Bill, I have seen that pruning technique in action also. I once saw a gentleman in his 80's take a 2 inch diameter limb off a pine tree at 60 feet with one shot using a 10 gauge shotgun. It was in the way of a wire antenna we were pulling up. I made a decision then and there: never argue with Sam! hi hi

Here is the rest of the story. We have a Satillte dish. It was in the clear most of the time but in the afternoon the high branches of this Manitoba maple would blow in the afternoon breeeze and block it. My wife asked me what I could do. My tree climbibg days are behind me. I have a severly broken rib cage and a popped disc so any fall would be my last. I told her to open the locked closet and get me my shotgun from the rear. She looked at me with distain. The alternative was a tree surgeon which was sure to eat up $150 to $300 . Was't going to happen here. Nothing on TV today is worth that money. And so I shrugged and continued on my merry way. About friday of the same week I came in and there was my long green gun case . "Is that the one " she asked. It was. Ten minutes later it was all over. I trimmed the whole tree while I was at it so I could forget it for 5 or 10 years. Went through the whole box of number sixes. I discovered that a 4 inch limb takes three shots. I used a Winchester 12 gua Model 1200 pump. Modified choke, 31 inch barrel.
She hasnt said a thing since except could she buy me a new box of shells. I refused. Just part of my duty as keeper of the castle. I have since used it for my ham antennas too. I am still a pretty good shot so they are safe. Someday though I may have to refrian. I am looking forward to this 29 deal. I will probably just listen this year. I get bad vibs too with my CW rigs. I think I get real excitied when I hook up with someone on my homebuilt 1 tubers and the adrenalin goes into overdrive.

I hear a lot about this deal. I dont know much about it but am most interested. I doubt my 40 meter 1920s style rig has enuf suds to reach anyone other than a neighbour . My rig we used is too new to qualify being a 1935 tube. My new Am rig is at least 1935 or later style although it will do CW at full mod control. so I am pretty well beat.

I have this 40 M rx/ tx working pretty good. My other 40 Meter stuff (1920s sets) work well but boh TXs could use a boast. I am going to breadboard a moderate Rf amp for them. I have a spare 50C6 tube and am used to using it. I have a doubler Ps built. Tonite I dug out a sprague AC line filter my brother gave me probably 25 years ago. NOS. I wired it up tonite for the first time. It got rid of the harsh hum I had before. Still got some hum about like you would get on a guitar amp but not a big deal. So since i can plug all my stuff in this line filter whch is really just a big double gang capacitor. I can get some isolation and keep the hum down to a dull mmmmmmmmmmmmmmmmm.
I have a transmit cap , a 4 ganger . I have the tube , a socket , stuff for the tank coil and am used to biasing these tubes from my 80 meter rig I am going to go ahead and make one up. I would like 5 to 10 watts output. My 80 meterrig does that as a power crystal oscillator so I am hoping a similar circuit but not oscillating should do the job. Time will tell.

Here is sits awaiting my descision on a tamk circuit and tuning cap.300 Volts DC , 50 volt ac filiment.
Copper tubing? Solid wire? A coil form? 150 pf , 365 pf 1000pf? Life is hard. 50L6 in place but once tested it will get my other 50C6. Should be able toget 2 to 3 watts out without messing up the signal. Screen modulation while simple really isnt. It has its own set of problems to work around.

Thursday it rained so I decided to fire up the newly acquired UX-210 I was so proud of. Good thing I did. It was DOA with an open filament! Seller said return it, so it's gone. Today I bought another one. Higher ouch factor but what the heck, eating is overrated anyway. This one I'm fairly certain is pre-1930 so all the better. The other may have been too, but wasn't quite sure.

I'm also waiting on a bunch of power supply stuff I bought. The chokes are '29 legit but transformers probably not. I'm trying to date them. I still have to buy tubes for the power supply. Oh, and a key. More ouch factor. How did I get into this? Wait, I remember, an old friend infected me with another incurable illness! It sure is fun though!

Good afternoon all,

I will be testing the Hartley/Windom early this evening between 6:30 & 7:30 PM. I will be CQing just above 7.1mc...dodging the foreign SSB & digital QRM and may QSY a bit at times. QSOs or swl reports will be welcome. I will be trying to use a RME-69 rcvr, but will also be using a Drake 2B as an assist. Its a bit breezy here, so the sig may be moving around a bit. I h ope to work some of you guys.

Thanks & 73 de Bill K4JYS (in NC)

The test was a huge success. Paul, N1BUG was worked along with another station in ME and one in NY. A fun hour or so. The freq, just above 7.1, was relatively clear. The stn in NY was very weak, about a RST 339 but was only running a HW-8 at 1 watt. Sigs improved somewhat during my QSO with Paul, and he said I went up to a 579C. The other stns also gave me decent reports....so I'm happy. It was great to work Paul and the other stns. I used the RME-69 w/o any help from the 2B (except as a cw monitor). I did use a WW2 beam filter as a audio filter, to some cans, which helped considerably.

Again, tnx Paul for a great QSO...73 de Bill K4JYS

It was a pleasure working Bill. When I saw his post about the test I decided to have a listen even though one half of my 40m inverted V is dropped straight down at the moment - removed from its tie off point due to ongoing home repairs.

Bill's signal had a bit of a chirp which made him easy to find. It reminded me of my early days in radio, tuning 80 and 40 meters looking for signals with some indication they were coming from a vintage rig. Copy was very solid. This was my first QSO with a '29 rig so it was a delight. Thanks Bill!

Yep.

I've tried them in my Hartley, and my PP TNT.

In the Hartley, they work great, in fact the best tube I've ever tried, so that's what is there and will stay there.

In the TNT, they don't behave well at all. Very chirpy and squirelly. It's a higher-mu tube (30, IIRC) than the 10, 45, 71A, etc. I suspect there's too much feedback, and, unlike the Hartley, there's no convenient way of adjusting the amount of feedback. So I've got a pair of 71As in the TNT, and they are very well-behaved.

Just my observations, YMMV.

:) :) Yep, I know about "chirpy and squirrely" 841s. My 1934 panel job used an 841 in the buffer/doubler stage. I spent a whole winter trying to fumigate it. I finally gave up and used
an 802. Much, much better than new!

Roger.

From: N1BUG
Topic: 3610 Message: 3610

I'm asking mostly out of curiosity, since I'm pretty sure neither of these was out prior to 1930. But if anyone can narrow down when these became available, I'd still like to know. Insatiable curiosity is a curse!

Thordarson T-6435 filament (hint: 1934 or earlier)

Thordarson T-6878 plate & filament (hint: prior to 1937)

I did manage to find out my filter chokes are "authentic" pre-1930 parts, but there are still large gaps in my collection of catalogs and advertisements. The two parts above I was not able to nail down.

Topic: 3615 Message: 3615

This is probably a dumb idea but I want to try again. I see the difference between a regen circuit and an oscillator is minor. Mostly grid leak (1 meg for a regen and 10K for an osc tx (as well as a regen has adjustable feedback, a tx does not. Other than that differences are really minor. I have a multi position multipole switch and enough parts and tubes to build a decent unit. I am going to try again. Anyone else played with this ?

3616. TNT tests

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-03 19:26:43 UTC
From: N1BUG
Topic: 3616 Message: 3616

Several months ago, when I did intial tests on the TNT, I had problems with it not oscillating. It would only oscillate if I put 15 or 20 pf (guessing, since I used a variable) across the grid coil. I thought I would have to modify the grid coil but I discovered switching sockets cured that problem. I switched from a Federal bayonet socket to an Air Gap (NON bayonet type). That did the trick for the tubes I had at the time: CX-301A, SX-201A, G-71-A.

Today I plugged a UX-210 into the socket and found it wouldn't oscillate. I once again tried putting the variable across the grid coil and it fired right up... 2 watts out for 6 watts in, 300V @ 20 mA. Not a bad note, either! It worries me that the antenna coil must be very tightly coupled to the tank to get any output.

It would seem, if I'm going to leave this tube in the rig, I will have to modify that pesky grid coil after all. I get the feeling this isn't the sort of rig where one wants to be changing tubes much. The name of the game seems to be get the rig to work with a particular tube and leave it alone!

I will proceed to experiment with the grid leak to see if I can get any more out of it.

73,
Paul N1BUG

3617. Re: [AWA Group] TNT tests

Yahoo group: AWAGroup (2010 — 2011)

From: N1BUG
Topic: 3616 Message: 3617

I'm done experimenting. Today's conclusions... with this particular UX-210 tube and the Air Gap socket...

50K is definitely the sweet spot for grid resistance. Efficiency and quality of the note suffer greatly if I go down to the recommended 10K.

Tuning of the grid circuit becomes more critical as grid resistance is decreased.

This rig tends to be a bit on the growly side. It was with all the smaller tubes also.

I can achieve nearly 3 watts out for 320V @ 22 mA while still having a good note (aside from the growl which never changes regardless of operating conditions).

The rig wants to be at maximum possible antenna coupling. Any less and output quickly falls to near zero. This concerns me but seems to be "just the way it is".

I plan to change the socket to one of the same type but better condition soon. I think I will wait to wind a new grid coil until I have the final socket in place, based on my past observations.

I find tuning of the grid circuit to be BY FAR the most important factor in getting a good note and good efficiency. Grid circuit tuning is rather critical (by that I mean sharp; it wants to be "just so" or else!)

73,
Paul N1BUG

GE Don,

Sorry we didn't make a QSO....tnx for the report. I worked a couple of stations, so made it a few miles up the road..hi. We will try again sometime. I used the Drake 2B listening for you...thot the RME-69 might not have good enuff selectivity..but did use it on the other contacts. I use a WW2 beam filter as a audio filter and works very well.

Tnx for your effort...73 de Bill K4JYS

I think it was as much fun for me to hear you. It has a very distinctive sound and pleasing which is whyI am giving you the 9 for T. has a bit of a whoop but tis a nice whoop. Easy to listen to and it doesnt get lost. I was using my Tnt which is shy on power but I had hopes. I may have been off a few Kcs too. I listened till you gave up on me and called a general CQ. I had the regen and the tnt all set up before but when I turned on the regen for our sked I had a bad Buzz. it wasnt there before so it must be something local. Just In case I had the DX160 on speaker and I wasnt long finding you. I have a hartley circuit in this Am rig I built but it is just fleapower. I am now inspired to build a bigger Hartley. It was really exciting to hear yours!

Morning Don,

I remember when I first ran across those unique sounds of the '29 rigs. I was just tuning around on 80m one Dec evening (its been over ten yrs now) and heard those signals and thought there must be some strange band condx. However, after listening a bit I figured out it was the AWA '29 QSO party. I was hooked from that moment. I soon joined the AWA and got started on a TNT...orig about 2 watts input, a CX-301A tube. After getting it working I still didn't know if it was getting out. I was building it out in the shop, in the back yard. I got the wife to go out and send some 'Vs' and I listened in the house....wow, that was a real thrill to hear the little chirper, even only 75 feet away...hi. I then called a friend who lived about 15 miles away. He listened to me and said I sounded like a Russian DX stn from the 1950s...hi. Then I later called CQ on 80 mtrs and got a stn about 30 miles from home for the first real QSO. So, to me at least, there are many thrills in this facet of ham radio. So, all I'm saying is keep plugging away and along with the frustrations, there will be some nice rewards.

I did tune around some and the freq was fairly clear but didn't hear a peep. Mo power...arrrrgh!! Up the B+, use a bigger tube(s), bigger antenna...etc. Try anything to get more rf...hi. I'm using a '10 in the Hartley at around +/- 350VDC or so and around +/- 40ma. It lights a #47 in the feed line to not full brilliance, but a nice glow. I try to use as loose a coupling as I can.

Ok Don, I'm ready most anytime for another try...just let me know.

Have fun and 73 de Bill K4JYS

I have an 80 meter glowbug and have worked down your way and south as well as Lou. (got pne of those super critical reports. ;>)) It is a single 50l6 which I know use a 50C6 in place of. It works well but is rock bound although as you probably now I made a variable crystal earlier this year that works. It however doesnt qualify being a 1930s tube. I could boost the B+. In fact I could steal it from the 80 meter rig (300 volts) i also have a 250 volt vibrator supply made from an old 6 volt radio. I had to smile at this "I got the wife to go out and send some 'Vs' " Been there done that as well.
I dont seem to have any willing helpers here. My own dear brother who lives up the road 5 miles and has a SW receiver (ww2) could listen for me and said he might do that some day. Of course I would prefer while I am still alive. . 20 years from now wont do me much good. I have a friend about 30 miles away who has a lot of radio stuff but is a CB guy. Hwould listen but says he couldnt tell because he doesnt know the code. The local clubs are closed shops. Never been able to get a conversation going. Course with my square head it may be a bit of a problem anyway, (Dulmage is really Dolmetsch) My wife says I am too direct. ??????
Anyway I am still slugging away . Today between painting a new door for the bedroom. I am working on my 50L6 PA for 40 meters. Of course that is no good for the 29 stuff but I have a vintage tube too so if the design works I will build a vintage copy. Anyway it was fun just the same. If I get some decent power going I will set up another sked. Any time you want a signal check from the the middle north shore of Lake Ontario I am here for you.

Discovery. I had a bunch of bad hum on my regen (40 meter single triode deal.) I didnt before putting it in the cabinet I use for my ham station so I went on a hunt. It was bad when the TNT was switched on but only if the key was plugged in. The key plugs in the side near the regen so I assumed it was too close however : I tried moving power wires in my ham cabinet, I tried moving wires in the TNT . I then changed wires on the key to key plug from an audio style cable to a plain set up made from a short extension cord. The bad hum is completely gone. In fact I can leave the regen on all the time . I am working the 7.1 and slightly higher with it every chance I get today. Someday I will make a connection. Field strength meter says power is decent comparatively speaking. My antenna is facing west and is shielded to some extent from the east by my house. You might ask why I put it there. The bracket was already mounted so it was a few minutes setting it up. That is why.

Don, I will look for you when I can but it may not be for a few days. My antenna farm is back in shape, finally, but I'm frantically trying to complete some outside projects before a surgical procedure next week that will put me out of that action for a while. I am anxiously awaiting arrival of an antique key and more power supply parts but will have the TNT growling soon. As soon as I get it all tweaked on 80 meters I will wind 40 meter coils for it. Then 160 meters I hope but am still contemplating how to make coils for that.

One thing I always wanted to try was a pair of 227s in a PP TNT. (Anyone who has read my posts over the years knows that I've run a PP TNT for years, but it's wired and has sockets for 4-pin directly heated tubes, originally 45s). I think 27s can still be had for relatively little money.

The 27 unlike the 56 is 1929-legal, and has a lower mu that the 56, therefore (from my experience) will be better behaved in the TNT circuit.

Anyone who wants a scan of the article from which my version of the PP TNT was built, contact me off-list. It was published in 1933 but the tubes and design existed in 1929.

Morning Don,

Maybe sometime this winter, we can all get together on 80 and/or 40 for some contacts. Its a little frustrating to have to put up with all the nets and digital crap, but I'm sure we can find a spot somewhere. Sounds like you have some neat old HB rigs to use.

I'm lucky in that there are some locals that I have known for a long time and can call on them, if needed, to give me a sig. report. You might give this a try if you can't find anyone to give a listen. Check out http://w4ax.com/ . It is a web remote receiver. He is in Ga. but has links to 26 other remote rcvrs around the world. Some are located on the US/Canadian west coast. The rcvrs cover segments of various bands. If you don't have a computer in the shack, again, get the wifes assistance...she can send the V's and you can tune around on the remote rcvr...hi.

Good luck with your projects...we can try another 80/40m sked most anytime. Just let me know when you want to try....73 de Bill K4JYS

According to my research and some on line source the new style bottle shaped tube was introduced by RCA 1930 . This set is a 1929 Grimes batteryless radio. When the old style bottle was introduced I am not sure but obviously before the 1930s new style tube. Anyway I guess it is back to my 45s for now as I dont want any borderline you dont qualify stuff. Who picked 1929 anyway? man rules can be tiresome.

Don,

If the radio came out in the late 1920s it would have used a 227. Someone may have replaced the original '27 with a 56. The 56 didn't appear until the early 1930s - I want to say 1932, but that's a bit of a guess.

According to a chart I have the 56 was introduced in 1933. I am not sure where the chart came from originally but I think it may have been from the book Tube Lore. I sure wish that book was still in print.

Also noticed that the 56 shows up in the 1932 R-10 tube manual.

This website (donsradiomuseum.com/dictators.htm) shows a Grimes "Dictator" batteryless set with the tube lineup. No 56 in there. Is that the same set you have?

Here is another source (www.aqcollection.com/antique-radio/article-1051.html) where someone is describing a Grimes 2171 batteryless set.

QST's indicate June 1932 for a date for the 56.

Hi Paul,

I'd say your odds are good on getting the majority of parts you need, with the exception of the above...

ANY electrolytic that's been lazing about, unused, is suspect after 20 years, or so...

ANY electrolytic that's been lazing about, unused, is suspect after 20 years, or so...

Hi Eddy,

I totally agree, though to my surprise I have a couple of 1 mfd 1920s condensers that continue to be viable. If I can find an old condenser which can be "gutted" I don't mind stuffing a modern part inside. I'm not sure that's possible given what I've seen or early filter condensers so far but there may be some types I haven't seen.

I am not going to worry about it. If its even iffy it will be a source of argument forever. I dont need the hassle. I will just build a 45 hartley and be done with it. Probaly all the 56s in this 20s radio were snuck in there by some milcious person who wanted to cause trouble. I have lots of other tubes to choose from.

Most of the condensers in this range from that era are oil-paper or
wax/paper, not electrolytics. Those can go leaky shorted too, but I've
come across several that are still servicable (sorry, Paul, got plans
for 'em!).

Paul, If you'd take WW II era stuff, I can give you some good 2 mfd 600V
(or maybe 800V or 1000V) PCB units.

Paul,

For the filter you may have to find an old '20s version and restuff it. Depending on the style, it probably wouldn't be too bad of a chore to do. And of course, check PTOP for your other needs. GL with your search...73, Bill K4JYS

Just thought I would take a shot in the dark. If anyone has any of the following that you would part with for appropriate compensation, please advise.

Cardwell variable condenser 178-B (71 plates, .0017 mfd) or 137-B (41 plates, .001 mfd)

0-.5 ampere RF current meter (Jewell 64 or 68, Weston 425, ???)

20s/early 30s 25,000 ohm resistor capable of dissipating 12+ watts continuously

20s/early 30s filter condenser, 2+ mfd, 600+ volts (higher voltage preferred)

Paul, sometimes old tube pins lose their connection inside. Resoldering the pins will usually restore the connection. I've done that with lots of '01A's.

Thursday it rained so I decided to fire up the newly acquired UX-210 I was so proud of. Good thing I did. It was DOA with an open filament! Seller said return it, so it's gone. Today I bought another one. Higher ouch factor but what the heck, eating is overrated anyway. This one I'm fairly certain is pre-1930 so all the better. The other may have been too, but wasn't quite sure.

I'm also waiting on a bunch of power supply stuff I bought. The chokes are '29 legit but transformers probably not. I'm trying to date them. I still have to buy tubes for the power supply. Oh, and a key. More ouch factor. How did I get into this? Wait, I remember, an old friend infected me with another incurable illness! It sure is fun though!

Don, I will look for you when I can but it may not be for a few days. My antenna farm is back in shape, finally, but I'm frantically trying to complete some outside projects before a surgical procedure next week that will put me out of that action for a while. I am anxiously awaiting arrival of an antique key and more power supply parts but will have the TNT growling soon. As soon as I get it all tweaked on 80 meters I will wind 40 meter coils for it. Then 160 meters I hope but am still contemplating how to make coils for that.

Thanks Bill,

I've been hammering eBay and PTOP for many months. Oddly the parts I thought were rare have been easy to come by. Some of this stuff I thought would be easy, but it hasn't been.

I expect to be doing minimal activity for a few days next week but after that building season starts!

Hi Leonard,

Thanks for the tip. I have heard that before and probably should have tried it. On a cheaper tube I would have. Figuring that was no guarantee I opted to send the tube back since the seller offered a refund. It seemed likely he wouldn't have been too happy about taking it back had I attempted to repair it.

I am going to try and make it receive too. I tried once before but quit too early. I am hoping I can overcome that this time. Today I had a real bad thought. If ac hum modulates a transmitter or receiver when used on the direct heaters even when filter and rectified What would happen if one modulated the Filment Dc with a carbon mike. Power is there. Voltage is right. I know befre long I will know one way or the other.
I know I shouldnt think about such things but I do. Still crazy after all these years.

Won't work - the thermal inertia (and therefore the electron emission)
from the filament can't follow a syllabic rate, let alone audio frequencies.

You may try plugging the carbon mike in where the key would be - i.e.,
in the cathode circuit - or have we already tried that?

Like the monkey said when he backed into the lawn mower. "It wont be long now!"
Got most of the holes drilled. and basic stuff mounted. Fabbed a grid leak from two flattened copper tubing strips and an old battery carbon. I will measure it all later to be sure before final mounting. Need to find some period correct brass screws etc. When it is all done I will take it apart and put a shine on the wood. I even found some period wooden knobs.
Cathode cnnectionis still up in the air. Direct to A+/B- or through a pair of caps. centre fed?

From: Jim Robson
Topic: 3680 Message: 3680

AWAGroup friends--I have passed my Basics with Honours and patiently await the arrival of my amateur radio license when duly processed by the guv'mint. I have a question or two for those that would have a moment to spare: I have been doing some reading on antennas and am considering the 'QSOKing' from Maple Leaf Studios. Do any of the members have any experience with this item and, if so, would it be a good match for my Heathkit DX40 and VF1? Also, I am considering buying a Heathkit AM2 SWR meter. Would this unit be useful for HF CW around 80, 40 and 20 metres? Many thanks for this. Jim.

3681. Mold Dust?

I've found a whitish dust on the outside covers of some of my hard bound radio books that stay on the bottom shelves in my basement radio shack. It looks like some sort of mold. It mostly wipes off with a damp cloth but a better cleaner is needed.

One possible idea for a cleaner is diluted bleach but that will fade the covers...but is better than the mold. Any other ideas based on a similar experience?

How about a dehumidifier for the room? Remove moisture and you remove the environment that mold thrives in. I

Hi Jim,

Didn't see a reply to your question. First congrats on the new license!

The "QSO King" should do very well. It's an off center dipole and will perform pretty much like a dipole on 80M and even better as you move down the bands (80-10M). Naturally it all depends on how high your able to get it up in the air too.

The hartley is coming along ncely. I guess I could fire it today but I am short some hardware. (4-40 nuts) I'll search my junk drawer and see what I have. Still have to make the cathode tap too but the rest is done. I am using a very small volue antique variable capo for tuning. I have come to the conclusin that it is better to optiize a set for the spot it will be used. I should be an ble to move almost .1 mcs or close to that as I have the same cap in a regen for fine tuning. I had often wished it was all I had installed. Because of the C value I made the tuning coil a bit higher in inductance. I can shorten if is necessary. Once I have the rig transmitting I will go to work making it receive.

Hi Don,

For an LC oscillator coupled directly to an antenna you need a low L/C ratio for stability and pureness of note.

If you are going to use a small-value air-variable condenser for bandspread (a good idea) you should parallel it up with a large one to get a low enough L/C ratio.

The ancients have treaded this path before!

BTW I am not actually directly coupled. I have a antenna link. My thinking was my TNT oscillates with plates open . This is back of that, (more pfs) so it may be ok anyway. We shall see. I am done and am charging my batteries for a decent test tomorrow after I make up some proper power cables. I also discovered only one of my 45s has a base lock pin. I may have to get creative tomorrow as the socket I stole from my Murdock parts radio is bottom contact and so the tube must be held against vertical movement. Anyway it survived the smoke test. Tomorrow we shall see if it makes RF.

Maybe a 203, 211, 245, 838, 845, 805, VT-4, series, plus many others. Sounds like a socket for a 50 watt tube. A 4-125 does not use a twist type socket.

Hi Don,

I agree with Mike---sounds like just the ticket for a 203A, or a 211, both of which are worthy contenders for the Kelley affair in December (the 203A and the 211 came out in, I believe, 1923).

Thanks fellows for the info. I will start the hunt .
Got the Hartley working better now . Had a bum tube. Subbed a DX235 (Special Canadian tube , low heater draw.) and removed the ant coil till I got it oscillating. Then I handheld the ant coil different spots (sight stinging sensation)and listened on a rx. On the grid side of the coil till the middle it kills osc but on the plate side it is fine. I then went through my tubes and found another 45 but it doesnt have the pin in the base. I held it in place and applied the voltage and voila. Strong osillations. It is getting a base pin in a couple of minutes as I cant afford to buy another. Tuning is a bit high > about 7.2 to 7.5 so i will have to pad it slightly. I tried a 150 pf and it worked but was a bit to the low side.(7.1was high end) Will try a 68pf next. Then I need to put some real B+ to it. It is currently running at 154 key down. Man, 45s are hard on A batteries! I might have to build a vintage supply. Tried direct cathode and split through resistor cap network. Still undecided there.
I shall begin the big tube hunt for that socket. Thanks again.

As I mentioned in a previous post my only good 45 had no pin for the old school socket. I installed one this morning and after the glue was totally cured tried it out. It works fine. I drillled a tiny hole and used a piece of old coppper hardline for the pin. I used JB weld as a glue although I had a good mechanical fit to start with.
BTW it also had a loose base but I have now found the absolute best cure for that. Mirror to glass windshield repair package. designed for reattaching mirrors to winshields it is strong colourless, flows in the loose tube base around the tube and is very strong. Best of all you cant see it.

OH! Good idea.
I also made a silicon rubber mold of an ancient Clairtone mica condenser. It is curing now and by Monday I should be able to cut it open with a razor and use the mold and some dark epoxy to hide my pun'kinseed condensors in so we look right.

I switched from my dummy load to the antenna and fired it up on 7.186 since it was clear. Power is good on the antenna, bad on the dummy . At one point I had almost 3/4 a watt and I am running this at low plate voltage at the moment. (line voltage rectified and filtered.) It should at least double when it gets the 300 volt supply. My Am rig was the opposite. Higher on the dummy and lower on the same antenna at almost the same frequency. Must be an error in my couplng link on the am set. Either that or the antenna is absorbing all I have from it to give. I am still waiting for the resistors for the PS for my amp for it.

From: N1BUG
Topic: 3710 Message: 3710

I'm still fighting with the grid coil. I will attempt to briefly summarize the history of this issue.

Federal bayonet socket, '01A tubes....
set would only osc around 5.3 Mc unless I put a variable condenser across the grid coil. Estimated 15-20 mmfd required to hit 3.5 Mc.

Air Gap socket, '01A, '71A tubes....
all OK, set worked at 3.5 Mc without extra variable

Air Gap socket, '10 tube....
set would only osc around 5.3 Mc unless I put a variable condenser across the grid coil. Estimated 15-20 mmfd required to hit 3.5 Mc.

There should be only minor differences in interelectrode capacity between the various tubes, per tube data. Surely there can not be much difference in capacity between the tube and other circuit components... a mmfd or two perhaps, but surely not 15 to 20?

The math and some limited experimentation suggest I would have to nearly double the turns on the grid coil to get the set to osc at 3.5 Mc. in either of the cases where it wants to work at 5.3 Mc. Surely one should not have to drastically alter the grid coil when changing tubes?

It is interesting that whatever the apparent cause it always wants to osc at 5.3 Mc when it acts up.

Something cannot be right. Perhaps a bad component that keeps changing? Grid condenser?

A parasitic resonance at 5.3 Mc that wants to "take over"? But where, what, why?

Any ideas???????????? I'm running out of hair!

Paul -

What are you using to determine the resonant frequency? If using a receiver, check to make sure you're not hearing the 2nd harmonic of 2.65 Mc (5.3 Mc).

Perhaps you're at actually at 2.65 and need to remove some turns to get to 3.55.

Just a thought,

Steve, KK7UV

Perhaps you’re at actually at 2.65 and need to remove some turns to get to 3.55.

Thanks Steve. All thoughts are greatly appreciated at this point!

The receiver is my primary indicator but I find nothing at 2.65. A frequency counter placed near the rig also indicates 5.3 (or 3.55 when the TNT is in a good mood).

What gives me the most concern is that it wants to jump back and forth between 3.55 and 5.3 when changing tubes or tube sockets. That just doesn't seem right to me.

Paul,

I know my Hartley did strange things when I had a bad RF Choke in the B+ line. Maybe that's the case for your TNT.

The TNT grid coil should be fairly broad band. Mine had little impact on the actual xmit frequency. Maybe a bad connection in the plate circuit or plate coil center tap?

Thanks Steve, Steve, and Niel for the suggestions!

I will check all connections on the rig again and try clipping another condenser across that grid leak. I'm pretty sure the variable condenser is OK but will go over that again also. My plate RF choke is somewhat arbitrary: about 2-1/4 inches of close wound #31 silk enamel wire on a half inch dowel.

I will report back after checking these things, probably late tonight or tomorrow. I... uh... seem to have become somewhat more involved than I had planned with building a '29 operating bench and vintage parts storage area! Funny how stuff like that happens! :-)

Oh I ve been there!
I dont know what the specs are for a 10 tube vers a 71 or 01 but I know a Dx235 has a lot more capacitance than an 01 ir 45 and it really threw me a loop. Also if you are using one of those new fangled superhets to listen to your tnt it could be anywhere and any mutiple of the frequency or the if or the differnce. If it has signal overload protection it gets worse . My DX 360 cant hear any of my tube txs unless the rf gain is way down. although the S meter will indicate. If you have a real revr aka a regen it will hear it fine. Or a recvr 80 to 90 feet away will as well. I well remember pulling my hair out wondering why is the signal there. (1/2 way between 80 and 40.) It turned out in fact it wasnt. it was the superhet thing biting me. Dont quit . You will get it. Whip up a quckie grid coil set up like it appears to want and try it. I did have to rework mine. Some of my stuff (question etc is probably still here . It was simlar to your current problem in fact near exact. I had to quit for a week till I got settled down. It works good now.

Paul,

My theory is that BOTH the Federal socket AND the '10 are dyslexic. To
confirm this theory try using both together; the output frequency should
be 3.5 Mc if correct.

Aha! Yes!

My sincere thanks to everyone who offered suggestions on this problem.

And the winner is... bad grid condenser.

Fortunately I had recently bought a bunch of these Sangamo condensers on a whim, hoping to get the right values for my next project. Included in the lot were several .00025s.

So I began going through them, temporarily clipping each across the existing condenser in the rig. Out of 7 condensers tried, only two acted alike; all the others varied significantly. The two that were alike both allowed the rig to oscillate properly at 3.55 Mc. The others were "all over the place" between 4.0 and 5.3 Mc.

I removed the existing condenser from the rig, replacing it with one of the two "best" from the test lot. Lo and behold! It oscillates perfectly at 3.55 Mc., the lowest plate current dip occurs slightly below that frequency (which I've heard is where you want it), and the note is somewhat less growly than before. Also, the plate current dip is now very broad, where before it had been quite sharp. That was another thing that never seemed quite right about this rig.

I don't know what ails the "bad" condensers. I tested all of them for leakage and they passed. I guess I'm going to have to break down and buy an instrument to measure capacitance.

Hi Bill,

I have not run them long term but have done some tests with several '01As at 320VDC. There were no immediate issues. Several months ago Lou tested one up to 400 VDC. Perhaps this link to his test results will work:

http://groups.yahoo.com/group/AWAGroup/message/2912

Assuming a tube doesn't flash over and destruct immediately, I suspect the voltage itself won't harm them over time. The increased plate current that results will no doubt shorten tube life due to filament depletion, but I don't know how quickly that will happen.

If one isn't particular about the age of the tubes, there have been quite a few globe shape '10s showing up on eBay for the past few weeks. I have passed on most because they either were post-1930 manufacture or I wasn't sure. (NOTE: I believe the Bruce Kelley QSO Party rules state the tube TYPE must pre-date 1929, but the actual tube can be newer. My insistence on actual tubes that were made before 1930 is a matter of personal preference.)

Question: Is the proper spelling of his name Kelly or Kelley? I have seen it both ways so many times I have no idea which is correct.

Once again, my orig. post didn't go thru...as yet anyway. I'll try it w/o the previous msg attached.

Tnx, Paul, for the good dope on the '01A. I'll bet when it was brought out, they never expected it to be put thru the higher voltages. It's a pretty tuff little tube. Possibly, some tubes of that vintage were built with wider spacing and more robust internal leads and parts, mainly due to the manufacturing processes. Later as the manufacturing processes got better, smaller parts could be made & handled easier...just my assumption. We hams are noted for pushing the limits..hi.

Yep, the tube type should be pre-1930...so guess that's why some of us are using the more modern type '10s or VT-25s, but still a 210 in the ST construction. I'm hoping to change to a 210 by time for the '29 party. Oh, and its Kelley...73 de Bill K4JYS

I met with great success this afternoon. I reworked the power supply a bit and made stole one of my homebrew dowel rod RFC from another project and instlled it in the hartley in place of where I was using something else (cant tell , tis a secret) I reset the cathode tap towards the ground end on link and moved some wires around on the board. I am now pushng 10+ watts on the meter every time. Grid voltage is -16.7V. Key down B + is 287V. Need to put a load/bleeder resistor on the power supply as swing is too much key up.need to make a power supply cable to the tx. Also need to make up a key cable and figure out which key i will use with it. Now i know that watts output is porobably high . I am using an old RS Cb unit that is rated 5/50 and 500 watts. So if it is wrong forgive me. What I do know is powerout is approx 20 times what it was before. Has been a very educational experience. I am going to go back into the Am rig and try the same mods.

Antique Electronics lists the "ST" 01A for $57. The "S" or globe shaped 01A's go for less, unless they have the tit on top and/or the brass base. If I buy any more 01A's, I would want to make sure there was continuity through the filament. If there isn't and close examination shows that the filament has not been broken, then the pin connection has probably corroded. That can sometimes be fixed by resoldering the pins. Old tube filaments can be broken by excessive current or rough handling.

Leonard

I met with great success this afternoon. I reworked the power supply a bit and made stole one of my homebrew dowel rod RFC from another project and instlled it in the hartley in place of where I was using something else (cant tell , tis a secret) I reset the cathode tap towards the ground end on link and moved some wires around on the board. I am now pushng 10+ watts on the meter every time. Grid voltage is -16.7V. Key down B + is 287V.

It's official! The thing works!

I am pleased beyond words to announce that greatest of mentors Lou, VE3AWA, has become my first QSO using the newly completed TNT. Band conditions were a bit rough with QRN and QSB at this end, but we made it! Thanks Lou!

I failed to test the rig into the actual antenna prior to the contact attempt. I noticed it was not putting as much RF current into the antenna as it had been the dummy load, but it was enough. I will retune and see if any more can be coerced out of it without destroying the note too badly. In any case, it shouldn't be too long before a power supply upgrade takes shape.

I have the rig now on 100% AC power supply and cabled up in reasonable fashion. I dug out an ancient key I have mounted on a pine board and made up a 4 ft cable from for the key from lamp cord. WRONG! Transmitter doesnt want to key with the long cord. Severe arc at the key and power down almost 50%. That long a key cable would need a RFC as well I think. It is also acting as a capacitor which confuses the circuit as well as it is absorbing RF. Went back to the short hookup and it works fine. Even called CQ at the lower end of 40. The rig is putting out good power. I still have a couple of things to sort out and then I will try for a QSO.
Congrats on the TNT QSO. Tis exciting the first QSO on a 1 tuber.

Now that I have this one working good I am going to embark on an extension and try and make it a transceiver. I tried once before with my TNT but I am going to try again. I know tis crazy but I found some super regen circuits in the 1940 Radio handbook that did just that. Added a few parts to make a tranceiver from a receiver. I will not hardwire anything so as to preserve my hartley as is but it might actually work. I have here a hartley regen running so i am familiar with it. I need to drop the B + condensor to the plate and switch that end of the coil to B- or ground. I need a resistor and set of earphones or audio transformer switched into the b+ plus line and that needs to go to a pot for controling regen (plate voltage really)Since the key is open normally I can leave the cathode circuit as it. AND THEN! if i can get it to work and I use a audio transformer in the B plus instead ofphones I can build a amplifier circuit for decent volume and reverse it to fed the audio transformer for plate modulation. I know its crazy but what if it works?

I have checked out a lot more. Checked frequency with my Kenwood 830s and a 3 inch antenna stub. I am tuned up on 7100 and will leave it there. I have some antenna issues.What, I dont know, but the antenna used to measure 1.2 to 1 SWR. Now it is pushing almost 4 to 1. If it stops raining and I get a minute I will check it out. Must be a connection or moisture in the coax connection or something like that.
Input is .046 Amps at 287 volts key down. Rig is senstive to hand capacity which ticks me off since my Am hartley is not at all. I may have to build another with my 1930s tubes to see if I can make one that isnt again. I think I know what the problem may be or I should say why this one is and the other isnt but talk is cheap . One good experiment will tell the difference. Anyway if anyone wants to give 40M a shot I am willing to try.

Making Condensors From Caps.
This is at the experimental stage but I made this mold up and took a 68 pf disc and made a 68uufd condensor. trial was in silcon because i hade it. If it perfects out I will make them from some type of plastic or plasitic like substance. It is still curing so is a bit wobbly for a couple of hours but it looks not bad. Obviously will need some trimming with a sharpe knife or exacto but I like the look. I can hardly wait till it cures enuf to remove and trim. Not my original idea . Others had it long before me. This is just my take on it.

Hi Pete and group,

I got behind on replies and am playing catch up.

I learned the hard way about some bakelite and moisture, while trying to clean old parts! The bakelite tube used for my grid coil does look like it would probably absorb moisture. (but fortunately the issue turned out to be simply a bad grid condenser)

I ran across something in one of the electronic supplier catalogs and it looked like it might have some application for re-creating old looking radio parts.

The item is available from Jameco Electronics (www.jameco.com) P/N 2112495. It is called ShapeLock and is a re-usable prototyping compound. It becomes rigid at room temperature. I do not know much more about it but it seems like one could take standard parts of today and enclose them in this material so they look like parts of old. I was thinking about look alike postage stamp Mica condensers made from today's parts.

The ad says you can make super strong custom parts, brackets housings etc. My application is that I purchased a very neat National vernier drive that someone drilled a mounting hole right where the N logo is at the top. My thought is to try and fill the hole with this material. I do not know if the material can be color matched but it can be painted. The small size is a 250 gram bag is $14.95 --so it sounds like a lifetime supply.

Perhaps this has been posted before so I apologize if I have repeated a subject covered in detail at a prior time.

That's a good question Bill. I had the same question several months ago. Some discussion ensued but we didn't come up with a definitive answer. I came away with the impression they were 1930s parts. However I noted an article in the latest AWA Gateway shows two such resistors and says they are pre-1930 resistors.

This would also be good for making the pot style filament resistor. I have not seen any listed at play things of the past.

Center tapped resistors as used in the TNT seem to be very scarce. However I noticed the Hull Hartley, published a year or so earlier, used two regular resistors in place of the center tapped unit. Since that made it a legitimate 1920s method my project goals were flexible enough to allow incorporating that arrangement in the TNT. I found Play Things of Past had some nice DeJur 100 ohm flat wirewounds that seem to fit the bill. He also had 25 ohm Yaxley resistors that might be OK, but I prefer the DeJur parts for eye appeal.

Subject: Re: [AWA Group] 'Dogbone' Resistors

Were the 'dogbone' style resistors available in the 1920s?

That's a good question Bill. I had the same question several months ago. Some discussion ensued but we didn't come up with a definitive answer. I came away with the impression they were 1930s parts. However I noted an article in the latest AWA Gateway shows two such resistors and says they are pre-1930 resistors.

It's official! The thing works!

I am pleased beyond words to announce that greatest of mentors Lou, VE3AWA, has become my first QSO using the newly completed TNT. Band conditions were a bit rough with QRN and QSB at this end, but we made it! Thanks Lou!

I failed to test the rig into the actual antenna prior to the contact attempt. I noticed it was not putting as much RF current into the antenna as it had been the dummy load, but it was enough. I will retune and see if any more can be coerced out of it without destroying the note too badly. In any case, it shouldn't be too long before a power supply upgrade takes shape.

Tnx, Paul, for the good dope on the '01A. I'll bet when it was brought out, they never expected it to be put thru the higher voltages. It's a pretty tuff little tube. Possibly, some tubes of that vintage were built with wider spacing and more robust internal leads and parts, mainly due to the manufacturing processes. Later as the manufacturing processes got better, smaller parts could be made & handled easier...just my assumption. We hams are noted for pushing the limits..hi.

Yep, the tube type should be pre-1930...so guess that's why some of us are using the more modern type '10s or VT-25s, but still a 210 in the ST construction. I'm hoping to change to a 210 by time for the '29 party. Oh, a nd its Kelley...73 de Bill K4JYS

Subject: Re: [AWA Group] Hartley & '01As

Hi Bill,

I have not run them long term but have done some tests with several '01As at 320VDC. There were no immediate issues. Several months ago Lou tested one up to 400 VDC. Perhaps this link to his test results will work:

http://groups.yahoo.com/group/AWAGroup/message/2912

Assuming a tube doesn't flash over and destruct immediately, I suspect the voltage itself won't harm them over time. The increased plate current that results will no doubt shorten tube life due to filament depletion, but I don't know how quickly that will happen.

If one isn't particular about the age of the tubes, there have been quite a few globe shape '10s showing up on eBay for the past few weeks. I have passed on most because they either were post-1930 manufacture or I wasn't sure. (NOTE: I believe the Bruce Kelley QSO Party rules state the tube TYPE must pre-date 1929, but the actual tube can be newer. My insistence on actual tubes that were made before 1930 is a matter of personal preference.)

Question: Is the proper spelling of his name Kelly or Kelley? I have seen it both ways so many times I have no idea which is correct.

3780. Re: 'Dogbone' Resistors

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-21 18:13:14 UTC
From: Don Buska - The Radio Lab Works
Topic: 3767 Message: 3780

Bill,

Allen-Bradley made some dog-bone style resistors that I found in their June 1929 QST ad (page 72). It doesn't say what they are made out of. They might be metalized resistors and not carbon, but still they are dogbone style.

The lead style resistors came about from "need" when new equipment designs moved to multi-grid high gain tubes and we began pulling away from transformer coupled stages. I started noticing leaded resistors in 1931 and later magazine projects.

In most of the 1929 designs if they used leaded resistors they were often mounted on an insulating board, which tells me that they were more like the older tubular cartridge style resistors (metal end caps) which got leads soldered to them by the manufacturer.

The 1930 Allied Catalog only has metalized cartridge styles offered. I noticed Allied didn't sell AB resistors.

In the 1933 Lafayette Radio catalog has carbon dogbone style resistors offered by Aerovox, Centralab and Trutest. These look like the ones I have in my junk box.

The 1938 Allied Catalog still has the dogbone style carbon resistors so that style had a long run.

Resistor manufacturer catalogs from 1929 through 1932 would help to fill in the progression of the dogbone resistors introduction. I think so much changed in component designs in the early 30's in all aspects relating to radio. Probably more across the board changes in the field until perhaps the move from tubes to transistors or thru-hole PCB to surface mount.

Bill thanks for posing the question. I have a fun doing these little investigative projects. Your question lead me to wondering when they shifted from dogbone style to the axial lead carbon resistors with the multiple color coding. It must have been sometime around or during WWII. My NC-100XA (1936-38) is all dogbone style, but my HRO-5TA1 (1947) is all axial style. Considering the HRO-5 series was much the same as the WWII HRO's that leads me to believe the change occured during or just prior to the war. Perhaps due to stricter government quality requirements needed.

I'm not sure how much I trust that AWA Gateway article on the resistors pictured. They also say the axial lead carbon resistor appeared in the mid-30's. Does anyone have a radio from the mid-30's with this type of

resistor installed? I guess if I had to I could open my National NC-200 receiver and check. It's from 1939-1940.

Thanks again Bill for the most interesting question. Outside of vacuum tubes there is really little information out there on the progression of passive electronic component histories.

100% right on Don. It was easier and cheaper in the battery days to just use different voltage batteries to get the proper voltages and then in early AC units they would use the big wire wound resistor to obtain the required voltages, i.e. National SW3. It wasn't until you had multigrid tubes when we start seeing more resistors required for setting DC levels on all those grids and for resistance coupling between stages. It then became practical and thus they developed new resistor styles and we start seeing them all over the circuit. It's always neat to not only see when a part was changed or created, but the reason for the act.

Terry - I don't know if you received a reply to your inquiry or not. I believe DCC refers to Cotton Covered wire which has become gradually more difficult to find over the years. You can build your wavetraps with normal #24 enamelled (varnished) wire and the results will be pretty much the same. I built several such wavetraps for my DX xtal system several years ago and they are very effective in both the 'inline' configuration with the antenna or when inductively coupled into other tuned circuits in the system. As usual, the higher your coil Q factor, the more effective the wavetrap will be so this usually means larger diameter and low loss coil forms. Good luck with your project and hopefully we can work during the upcoming BK '29 QSO Party.

I totally agree, it is interesting stuff. I'm still struggling to get up to speed on what was available when and how to date parts. It is a long hard road for one who does not have much literature from the time. I am always very grateful for the bits I pick up from those more knowledgeable. The resistors for transmitting grid leaks are a real "bugger" for those of us building '29 rigs. There aren't many around. I've recently come up with some 15K and 20K ohm '20s style resistors which look similar to receiving grid leaks. I'm testing them to see whether they appear to be able to handle enough current to serve in transmitters. My preliminary conclusion is that they would probably be OK since the duty cycle would be less than 50%. But I'm only guessing at how much current they actually see in that application and I'm sure it is dependent on tuning.

Good observation, Don. About the only resistor needed, rcvr wise, were the grid leaks and they were usually in a glass tube. And maybe a few for pwr supply use and they could be wire-wound and could be homebrewed. I was looking at a xmtr osc. ckt in a 1924 QST and the grid resistors looked to be round with come color bands....hard to tell, but probably axial types. Also the grid and bypass condensers looked to be maybe an inch or so long and basically square shaped. Its interesting to see how the shapes of the basic components have evolved.

Good luck on the antenna fixing. Entice your brother with a good meal (that's what gets me). Too bad he's not a ham. Tell him you got an important test waiting on that antenna work. Also, good job on the HB parts...when are you going in production.

It's cool dwn here, so QRN is low...I'm patiently QRX for your sigs....Bill K4JYS

Hi Geo and tnx for your info on the over-voltage effects on the old tubes. I expect back in 'the day', the typical ham, like some of us today, would push tubes to the limit and beyond. Back when tubes were plentiful, one probably could deal with loosing one on occasion. But now days, I hate to loose any tube, esp. the 20s & 30s types to this type of experimentation. However, I will admit to running a bit over 200VDC on a CX-301A...and its still ticking, but not in everyday use. Hopefully, the limited use will not do any major damage to the emission characteristics.

Tnx agn for your very interesting comments....73 de Bill K4JYS

Terry, I made a wave trap for one of my transformerless regens but it had almost no effect. What did work was a bypass cap acros the AC line input. Sometimes it takes a combination of both.

3794. Glows in the dark

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-22 02:32:46 UTC
From: Don
Topic: 3794 Message: 3794

I had the hartley fired up on the dummy load and was watchhg it in the dark. I have a tube that glows blue when osc, Probably argon in it but it flashes blue everytime I key. Doesnt show on video camera for some reason but is real obvious when you are standing here.
Also made a silicon Postage stamp condensor today Solar copy. Didnt get the mold lined up perfect but I will next time. And now for the fun side. I made the first mold and tested it making my polymet condensor which is now installed in my Hartley. I cleaned the mold and sprayed it with PAM to allow for a good releae. Mwife is a choclate molder and was doing some today. I borrowed a spoonful thinking it would be nice to have Condensor chocolates. Something about chocolate and clay. It was impossible to get apart and eventually I had tobreak it. Luckly I had made a better mold for both polymet and solar condensors. Stil I didnt know how strong chocolate could bond with air dry clay. One drop holds thusands as the ad used to say.

Is the blue glow between the elements or on the inside surface of the glass?

The former is an indication of a gassy tube (there should be no argon -
it's not put there intentionally and if a tube is gassy it's more likely
to be nitrogen, oxygen, or H2O vapor from a slow leak or desorption from
the anode or other elements).

If the glow is on the inside surface of the glass it's fluorescence from
stray electrons hitting the glass, and it's an indication of a good, hard
vacuum and, as Martha Stewart once said, is A GOOD THING.

OK guys, the pictures are done. I'm not entirely happy with them, but you will never hear me claim to have any skill with a camera.

I know this group is all about being supportive, encouraging and all, but I would appreciate constructive criticism. Where did I go wrong, what did I do that doesn't represent the period, etc. OK, I know the binding posts are a cheat, what else? I would much rather hear what I did wrong now than to repeat the same mistakes on the next build. Seriously!

Below is a half size photo. High res version of this and many others are available on my web site along with very preliminary first draft comments... to be expanded later.

Aha! Yes!

My sincere thanks to everyone who offered suggestions on this problem.

And the winner is... bad grid condenser.

Fortunately I had recently bought a bunch of these Sangamo condensers on a whim, hoping to get the right values for my next project. Included in the lot were several .00025s.

So I began going through them, temporarily clipping each across the existing condenser in the rig. Out of 7 condensers tried, only two acted alike; all the others varied significantly. The two that were alike both allowed the rig to oscillate properly at 3.55 Mc. The others were "all over the place" between 4.0 and 5.3 Mc.

I removed the existing condenser from the rig, replacing it with one of the two "best" from the test lot. Lo and behold! It oscillates perfectly at 3.55 Mc., the lowest plate current dip occurs slightly below that frequency (which I've heard is where you want it), and the note is somewhat less growly than before. Also, the plate current dip is now very broad, where before it had been quite sharp. That was another thing that never seemed quite right about this rig.

I don't know what ails the "bad" condensers. I tested all of them for leakage and they passed. I guess I'm going to have to break down and buy an instrument to measure capacitance.

Topic: 3809 Message: 3809

My brother was here. All coax connectors were the problem. I think it is ok now but I am not brimming with confidence. . Stuff is falling apart at the connectors. Just out of energy to recheck once more. I really need all new coax. Power is now down where I think it should be . It seemed unreasonable before or unbelievable.I think my wattmeter measures both ways and totals it.I am now showing a max of 2 watts on the thru meter. I will give it a shot at 7 PM tonight. I am tuned up on 7.999.9.
I have forgotten most of the Q codes save QRL QRZ QRT QSL QSY so if you expecting Joe radio op you will be disappointed. I am tryimg to retrain my brain on CW three digit signal reports. (ie 55N or 5NN ??)Too many years of 5 by 9 reporting.
So bear with me. I also tend to get excited if I get a cw reply. Despite all these handicaps I will give it a whirl and try and stay calm.

I bought this radio about eight years ago. I can not find any name on it. One of the tubes is a Cunningham 301-A and others look to be 01A bayonet style tubes. The last tube on the right is printed 5 volts.

Photos:
https://plus.google.com/u/0/photos/101474642675993552832/albums/5666421603990497137

The screw terminals on the front panel are from left to right:

ANT GND ? ? B+ A+

Please tell me what I have?

Thank you

Robert

I did some more looking and found the name "FADA" on of the tube sockets. I
did a google search and it appears to be a FADA neutrodyne radio.

Hello all,

Have been mucking around with my old website, the current site, built on now 10 year old Microsoft Front Page, has been very difficult to update,
which is why it's been static since July of this year.

I had a woman who does my biz website make up a WordPress type site, but not in love with that either.

I've seen Niel and other using a more Facebook type design, like a blog design,
http://w0vlz.blogspot.com
which seems cleaner, and allows one to readily see the updates.

Wondering what the group thoughts is on this matter?

Old W1UJR site (which I can not update) --> www.w1ujr.net

New, Proposed Design W1UJR site --> www.w1ujr.net/new

Blog style W0VLZ site --> w0vlz.blogspot.com

The old feels more comfortable, but wonder if it is really not as good
for the reader.

Your thoughts, opinions, suggestions, etc.

Cordially,
Bruce J. Howes W1UJR

I'm a fan and collector of the that wonderful old gear, and I must say that I do like the N1BUG transmitter, very, very well done!
You've have made John W1FPZ smile with that one, esp the clever index on the dial, pure brilliance!

I'm getting back into the groove for what can only be described as a bit of a hiatus from radio.
Have been very busy at work, home, traveling, etc.
Finally the cold weather is here, so radio time begins once again.

Plan to be active on the bands, esp late nights/early mornings.

Stay tuned!

Interesting discussion. I've had a similar situation arise.

I visited my local radio collector and historian today. I took a pair of '81 tubes over to be tested. He gave me a piece of mahogany which I intend to use as a base for an antenna coupler and a 20s 'homebrew' receiver. I suspect the receiver was a kit. It looks nice. I can't post a picture of it because he is dropping it off tomorrow. I couldn't bring it home on the bike. Point is, he said use it for parts... and it does have some nice parts I'd like to use. But I'm not sure I can bring myself to tear it apart!

Hi Bruce - I must say that I like the clean look of your new blog page. I just realized that although I do visit blogs from time-to-time, I have none actually bookmarked...unlike the dozens and dozens of websites I have bookmarked. I guess my usual experience with blogs is that it is often difficult to find something specific that you saw there in the past and one often has to sift through the month to month archives.

I very much enjoy reading Neil's blog but again, I only find myself going there if someone or something else has directed me or brought my attention to something there. I like the layout of your new site as it has all of the hot spots listed to the right so it would be very easy to find something that you were seeking with little hunting involved.

That being said, I very much enjoyed your original website and visited it many dozens of times. I also find myself avoiding blogs where a daily posting is way too long...Neil has the right idea in that respect, with short, to-the-point, blogspots.

I will now make a new 'BLOG' folder in my bookmarks file so that I can and should visit some of these places more often as many of them are extremely well done.

I catagorize my old radios in two ways. Restorable and parts. If it is looking like it shuld with all its faceplate and knobs and such not bent and in good shape and the cabinet is decent then i leave as is and try to get it working. If it isseverely damged or has been cobbled and cant be put back it become parts. IE I bought a Atwater-kent this spring that is pretty good. only missing a few brass screws and the AT logo plate (whichI am still looking for.) It will stay as is. A fellowgave me a Murdock radio chasis. While electrically it was probably good there is nothing left of what imakes it look good so it has become my parts bin. Now we come to problem 3. How many Regens and 1 tube transmitters do I need.?
You could post a pic of it and we could do the gladiator thing. Thumbs uo thumbs down and the majority rules. Restore thumbs up(J), parts thumbs down.(P)

Well They are real easy to make. First go to Michaels Craft store. Get some air dry clay. Find your favourie Condensor and make two pieces of clay just a bit wider than your condensor. Take some saran wrap and put it carefully over one piece. Take you favourite condensor and press it into the saran wrap covered clay about 1/2 depth. Make sure to make wire end impressions too. Take the other half clay piece you made . Press it on top, pressing very hard to get it tight. Using a dowel or nail make two locating holes in the parts of these molds away from the condensor. These are your alignment holes. Remove the nails and pull the halfs apart. Remove the condensor carefully . Cook the halfs at 400 degrees for about 1/2 hour. I used my shop toaster oven I also use for making casting cores for aluminum. XYL said no to her oven. Ok it was NO!!!!!!!. Clay should become grayish. I use silicon for my condensors. It is ok for me because it comes out of the mold. Takes about a day to get it cured well. Longer is better.
The saran wrap used in first allows the raw clay to seprate which is important on making the impression. It conforms to everyhing well and doesnt mess up detail. Once the mold is made you no longer need it.
To make a new condensor. Take your new one. I use disc ceramics . Bend the wire ends so they come out where you want them too like the old condensor did. Make sure when the wire ends are in the wire paths in your mold and the disc ceramic is not touching the sides of your mold. Remove it. Fill the bottom half with silcon and place your disc ceramic in it. Fill the top half of your mold with silicon and using aligning pins fit the two halfs together. Press till it ozzes. Set it somewhere inconvenient to get to. Put some weight on it and leave it for at least a day. It takes patience to pull apart. Just apply pressure to release (Remove alignment pins first) Eventualy it will come apart. Lift the edges or excess from the mold first and work to get it out. Trim the excess with sharpe scissors and Viola.
An alternative to alignment pins is to purposely make the outside (away from casting hole) irregullar so the mold only goes tight in that postion. That is what I did BTW. I am not real gifted in this kind of stuff. Some of you are and will be able to produce beautiful condensors. Silicon comes in many colours. You chose.

I got up early and rechecked my antenna for continityand shorts. All check out good. Why the Hig SWR?
I made up a po'boys Noise Generator. (Dont ask but if you have ever worked around coils and tank circuit with a receiver nearby you know that any pulse applied is on frequency. Even a click.) So what is the natural frequency of this inverted V ? Turns out very definatley 6.1 MCS. Why I got bogus reading is probably due to my open coax which is now repaired or it could be faulty memory too. Anyway I have to shorten the legs. By how much I wonder?.Maybe a foot would be the place to start. I will mull that over as I go about other chores today. SWR is 4 to 1. I clipped a test lead on one leg to lengthen it. It did not improve so I am thinking I am on track with my assesment. I have an 40M inverted L I used for the museum thing. Maybe I will hang it today as well.

Don,

If the antenna is really resonant at 6.1 Mc now you may not notice any change at 7.1 Mc by taking one foot of each side. The theoretical difference in length between 6.1 Mc and 7.1 Mc would be 5 feet, 5 inches each side. That is a lot. I would not cut that much off on the first try unless I was very confident of the 6.1 Mc measurement. Also if there are other wires or large metal objects near the antenna, the amount you end up taking off may not match the theoretical very well. But I think it'll be several feet. Good luck with it.

Don, seems you are having a lot of antenna problems which could be one reason you aren't getting down this way. Hope you can get them fixed before your real cold wx comes up. The following suggestion is just from my limited antenna knowledge and experience. I'm not sure how much room you have or how hard it would be to put up another 80m half wave wire. I have been using an original 1929 windom (then called a off center fed hertz) since around 2000 or so. It was the suggested antenna for the 1929 TNT. It is simple, just a half wave wire, with a single wire feed line tapped off center (charts in old QSTs). The feed line can be any length. For my TNT, I just tap the feed line to the tank coil, thru a mica. For the Hartley I tap the feed line onto a coupling coil with a parallel var. condenser. For other HB rigs I just wrap a few turns around the hot end of the respective tank coils, hook the windom to one end, the other to gnd. I have no idea what the efficiency of this type of set up is, but seems to work. I use a #47 lamp in the feed line (with a shorting knife switch across the lamp) as a tune-up indicator. The first windom (still in use) is up maybe 35 feet. A second one is up maybe 45 ft and in a diff. direction. Both seem to work well. I'm sure there are other antennas that would do a better job (loops, edz, etc), but this one is simple and no coax connectors or tuners involved. Good luck with what ever you wind up with.

or run it through a tuner so that the tx see a 50 ohm resistive load. The difference in performance between 67' and 66' feet would be unmeasurable in your on-the-air signal.

I attempted to post links to pics of it but either it got marked as spam or it never made it past my flaky wi-fi connection here. Doesn't matter. Once I took a closer look at the radio, I decided it is a parts unit. It is not well built, has some extra holes in the panel and cabinet, etc. However it does have some parts I can use.

It is not well built, has some extra holes in the panel and cabinet, etc. However it does have some parts I can use.

But it's the parts we want to see, Buggsy!

I moved the lawn tractor , raised the end hieght and cut a foot off both ends. I put it back on my big rig. Kenwood 830S
Sweet spot is now 7.172 and still good down in the low end although a bit higher. HOWEVER when on my Hartley it is still high. I may actually have to make a matcher . I have avoided this for 30 odd years but it is the only conclusion I could come too as to why the big difference. Thanks for the tips on length. It may have been the lawn tractor bothering it before with the big rig as it was parked near the north leg.. I have thought about a Windom. I have had real good luck with my inverted L on 80 and it isnt high at all so I tend maybe to lean that way a bit. I should see if you can hear it Bill (rockbound 3555.)but I did work NC earlier this year. Anyway I know the inverted V is now good. Just have to figure out how to mate it to my Hartley and TNT for that matter. (Then the single control AM rig!) 35 feet up or 45 feet is not impossible but I would need to suck up to my younger brother again.

I need to learn more about transmitter to ant coupling and matching. My 50L6 tx worked with no problem right out of the gate, My 40 meter TNT. RX /TX and Hartley seem not to like my 40 m antena but my kenwood loves it. What could i do with the antenna coupling link from the transmitter to make it closer ? Or is that possible. I have this antenna down into the acceptable range now but just. I strung up an inverted L for 40 this afternoon from my museum display. I have it almost ready to go but need to finallize the ground clamp . Maybe I should have made my inverted V 300ohm feed. I thnk if I had a pi network instead of a standard tank I would not be having this converstaion. I am now trying to come up with an easy to build antenna matcher. I have some variable caps. I have some more copper tubing already wound.. I am just not sure what to build with what I have. Would this do anything or am I thinking wrong?

Don - all you need to do for the TNT is to series-tune the copper antenna tank coil with a variable...try around 500pf if you have it. You will find a point that everything peaks up and the output power (if you are watching it on an swr bridge) will also peak up significantly compared with just the link only.

This result is almost certainly because (1) your Hartley is not transmitting on the frequency you think it is, or (2) the output from the Hartley is rich in harmonics (and the antenna system presents a high impedance to the harmonics, hence the high SWR).

> I may actually have
> to make a matcher . I have avoided this for 30 odd years but it is the

This may help filter out harmonics (depending on the type of network you choose), but be careful to make sure the rig is on frequency first, to make sure you aren't tuning up on 8 Mc or some other frequency on which you are unlikely to make contacts ;-).

Good advice - this is what I do for all my rigs with link-coupled outputs (of which my Hartley is an example). What you are doing is series-resonating the link to eliminate the reactive component. I use a 3-section air variable from a late-1920s broadcast TRF radio, with all 3 sections in parallel, switched between multiple link-coupled transmitters. This works well for 80 and 40M. For 160M it needs to be padded with an additional 1000pF transmitting mica.

What also works well is what Bill K4JYS does - tapping of the tank coil with a mica condenser, no link. The tap will be very close to the cold end of the coil when feeding a low-Z (~50 ohm) system - for my PP-TNT it's about half a turn from the center tap. Load too heavily, i.e. tap further up the coil, and the note will suffer.

Raising (or lowering) the ends will change the resonant frequency of an inverted V just as will changing the length of the wire. I'm glad you found a combination that works for you.

As I mentioned in my previous response, I think you observations are consistent with your slef-excited rig(s) either off-frequency or high in harmonic output. Either is not unexpected. I have used a frequency counter or a grid-dip oscillator to verify my frequency.

That said, I always use a tuner for 160M-40M as the wire antennas I use on those bands are fed with balanced open-wire line ("tuned feeders") which require a tuner and make them efficient multi-band antennas. The simple design I use in the cellar shack is an inductor with center-tap grounded and connected to the input coax braid, with the input coax center conductor tapped 1-3 turns one side from the center (depending on band & antenna in use). A split-stator air variable of about 50 pF/section is used, with each stator clipped an equal number of turns on each side of the center-tap, and the common rotor floating (this is important!). The balanced feeders to the antenna are also clipped an equal number of turns on each side of the center-tap, but closer to the center tap than the leads from the air variable. Tuning parameters are the 5 clips (input coax from transmitter, the two clips from the air-variable stators, and the clips from the feedline), and the setting of the air variable. It sounts complicated, but once you find a match you note it and it's very simple and fast to go back there. You can also feed a single-ended system (random wire, wire-fed Windom, for example) by just tapping on one side of the coil. The design is similar to the classic link-coupled tuner for parallel feed, but instead of the input link you tap a few turns on one side or the other of the coil (which side doesn't matter), and it works equally well without the additional mechanical complexity of the link.

With this system I can tune both my wire antennas, both center-fed, one cut of a half wave on 1060M, the other cut for a half-wave on 80M, each on 160M, 80M, and 40M. I could also use these antennas on the higher bands with this tuner design but would need a smaller inductor. I don't bother because I have a tribander on the tower which I use for 20 - 10M.

There is a high-value audio coupling choke in the BC-221 and LM series frequency meters, but a good unit is too useful to consider cannibalizing for the choke. A junker, on the other hand, would be a viable source.

Alternatively, resistance coupling works well (see, for example, the design of the Pilot Super-Wasp).

Hi Eddy,

I very much wish I had cultivated this antique radio interest years ago while things were cheaper. I guess what they say about hindsight is true! I often wonder if it is less expensive for those who are able to tap flea markets as a source of parts.

I will see you in the 160 CW DX pile ups this season. I've only been on briefly to chase two potential new ones, both of which eluded me! I still have a renovation project urgently needing to be completed. I've been set back by health matters. My radio time will be limited until the place is winter ready. Good luck with your antenna work. I need to spend a day or two in the "badlands" repairing Beverages.

By the way, I also plan to put my TNT on 160 meters at some point. I'm contemplating the matter of the grid coil.

This ARRL auction reminds me of an event I experienced just yesterday at my local hardware store. Outside the store was a very large cardboard box (3' x 3' X 3') which was empty and there was a sign on it which said " Sale $0.50 each". Even I looked in the box and wondered what I had missed that was on sale in this very large box and it only cost 50 cents. During the course of my visit which was about 10 minutes total most of which was me standing in the checkout line, I heard four inquiries about what sale item that was missed that only cost $0.50.

So here is the hook and connection to the ARRL--- it seems the hardware store had been some doing renovating and had installed a new display shelves that replaced a rack full of small plastic bins. It was the excess plastic bins that were on sale --but they sold out quickly. What the store discovered was this was a great gimmick to get you into the store where undoubtedly you would buy something! What person goes into a hardware store and doesn't end up with something coming out of the store. Well so it is with the ARRL -- what ham visits an auction site who doesn't see something they would like to have? So the ARRL's now that they have you on their site, hopes you will bid on something and $40 for an extinct copy of the repeater handbook probably is the loss leader. We all love sales especially where there is some grabber like an empty box and what was in there only costs $0.50. Bottom line: Well now that I am here I might as well buy something --the hardware store concept.

BTW -- I did find the 1/4 inch 8-32 bolts so I could install the new doorknob loading cap in my SB-200! My local hardware store actually sells hardware by the piece --I didn't have to buy a 5 pack or 10 pack when the need was for only one.

The regen receiver in the Paraset also asks for a high value choke so I experimented with some of the old audio xfrmrs that I had pulled from various radios over the past 40 years. It turned out that all of them worked fine (just use the winding with the highest resistance value)...some of them worked better than others, but all of them did the job. I eventually ended up with a very small one pulled from an old car tube radio which did a superb job.

Update!
Got it! Sat down and thought about it. Tried the series cap but osc didnt want to start everytime. I also checked frequency with my most relaible device, my regen. On a regen unlike a superhet if it aint there it aint there. Was good top end of CW band to almost the bottom. I redesigned the Ant coupling coil. Also checked with two other recvrs later to verify. So after some deep thought I removed the large coupling coil that went over part of the osc coil and made one for the end like my TNT (which loads up fine on the Inverted V I discovered as well as the new Inverted L.) I made the turns ratio the same as my TNT.I made it so I can adjust spacing and after a couple of adjustments Bingo. Osclts good and SWR is below 2. I bought a spare tube of Ebay. It will be fun to see if it is betrer or worse than this one.

essentially a "no show band" up this way pretty much after Christmas, until April!

A lot of bands are no show I think. I was on with my TNT last night. I know I was getting out because the fellow would patiently wait till I called CQ and got no answer and then step in and call CQ himself. He was very careful not to step on my toes which I appreciate as many dont care but I wonder why he didnt just answer me. I tried going back to him but I think the Squawck of the old style rig may have scared him off because he went silent for about 5 minutes. . His CW was very nice and evenly paced and easy to copy. N0___ something.

Topic: 3858 Message: 3869

I wonder if anyone here has ever measured the inductance of an old TV or computer monitor flyback transformer secondary? I know those large inductors must be made of very fine gauge wire and I would assume that the wire in the old flyback transformer is also very fine.

Just a thought as we are seeing so many old PC monitors being tossed out today and maybe they would make a good source of a high inductance coil. If they are we'd better act soon because eventually even the PC CRT monitors will become a rare item.

Hi Don,

I really & truly am convinced that some of the guys like the one you mentioned are fearful of somehow being deemed "complicent" by the very fact that they work you, an obviously "non-conventional" sounding signal...

Can an "OO" report implicating them be too far away...?!

I experienced the same thing way-back-when, attempting top QSO US Novices (1972 & thereabouts): the "VE3" prefix threw more than a few for a loop, & you could almost taste the fear factor at the other end! (as in, "Where's the beef, err I mean, "N"...?!). Hi Hi

"Modern" white ceramic beehive insulators usually designated IN-89 show up on eBay quite often. A wild speculation/guess on my part which may be well off base is that they were used in some military apparatus, perhaps of roughly WWII vintage. The older brown ones (and blue ones) show up from time to time also, though they seem to be less common.

When I started my TNT project as a newbie last January, I was SURE some of these old parts were absolutely unobtainable. I was wrong about most of them. It requires patience and diligence but they are out there. From my still somewhat newbie perspective I suspect there are a few of the old parts that are indeed very scarce (I've not yet seen a single example of them in the wild) but I would not list beehives among them.

You cound use a 150Hy choke from Radio Daze, or use an okd auto ignition coil if you want more Henries. For audio coupling I've used chokes, interstage transformers, and resistance coupling, and it's difficult to tell the difference (at least at my age) Build the circuit first, then try to improve it. You won't really know what works until you try it. What works in one circuit won't necessarily work in another.

Please forgive the "newbie" questions. That said, I am looking to build a 2 or 3 tube regen receiver, and a lot of the schematics call for a 500 or even a 1000 henry choke. What do you use in place of one of these? I do not have a vast junque box to pull from and most of the chokes sold today, barely go above 40 henries...

Thank you

Here's a question for ya.

The 1929 receiver I want to build calls for a "Clarostat universal resistor" for a regeneration control. Elsewhere it is referred to as "Clarostat variable high resistance".

What was the resistance range of this device? Was there more than one range? I have found them in many late 1920s magazine ads but no resistance value was given in any of the ads. Just a lot of flowery words on how fantastically wonderful they were and the words "See your dealer". Somehow I don't think my dealer will be able to help me. :-)

I've not yet seen one of these in the wild and will need to substitute a different potentiometer. But what range do I need to look for?

Help!?

I thought of those, but. I assume that the bolt that the coil is screwed to, runs all the way through, to the bottom side of the board? If so, I thought that the "hot" bolt in contact with the wood might not be kosher.

It certainly gives it the "farm" look, and we know all hams were not city folk. :-)

Two votes so far for trying to get it running. I admit the thing has a certain appeal to me, which I cannot quite explain! If I had tubes I would definitely make the effort but don't think I can justify the expense on a radio I'm told doesn't work. I poked around a little and the only problem I can see is an open primary on the audio transformer between stages. It does have a headphone jack at the detector output so that stage could be fired up alone. I have not hacked into it yet and will leave it be for a while. Maybe I will get the urge to buy tubes for it.

The grid leak on the detector stage is (to me) and odd device. It appears to be a rotating (carbon?) disc with contacts, totally exposed. Its range is from almost nothing to around 280 K ohms. That seems very low resistance for a receiving leak but I am not familiar with the requirements of the '99 tube. Comments?

AWA group friends,

This getting on the air is proving very strenuous: I have two vehicles in my 'shack' that have been sitting for 14 years. I attempted to move them, by hand, last weekend, but no joy; I credited my advanced years.... Today, I reasoned that jacking the cars up and rotating the tires of the 14 year induced flat spots would reduce the rolling resistance; in the meantime, all the other good junk is piled around my bench. So, I jacked the 1973 Newport up, the brakes are seized. I checked the T-Bird: the brakes are seized. Good news in a way...confessing being 'elderly' is, hopefully, premature. This weekend, the tools come out, the wheels get freed, the vehicles get moved, and my station, consequently, will be free.

One other thing: settled on RG213 co-ax but nobody retails the stuff in my area; all on-line. Must order co-ax. RG8X looks like a good alternative; Durham Radio in Whitby sells pre-fab lengths with the connectors. It is about a 100 foot run from my end fed antenna to the hole I drilled in my thermal window.... The dB loss is a bit higher than RG213 but I am only, eventually...!, pushing 40 watts. I reason that a bit of silicone will repair my thermal window.

Question: in general, what do the members prefer for co-ax?

Many thanks for this,
Dusty,
VE3BHK

Hi Dusty,

I'm happy to hear you are making progress! Seized brakes do make it a bit tough to push a car. :-)

Ask 100 hams for coax recommendations and you'll probably get 100 different answers! My opinion: On the lower bands (160, 80, 40 meters) you'll never see the difference in loss between RG-213 and RG-8X. Just be extra careful to keep water out of the RG-8X with its foam dielectric. On the higher bands (10, 15 meters) the loss is more of a factor but still for most hams it will be insignificant. If one were planning to be a serious DXer or contester I would say it matters... but otherwise, no. VHF is of course a very different situation.

I am a serious DXer, etc. among other things... and you probably don't want to know what I use for coax! It's over an inch in diameter! But my runs are also a few hundred feet long for the most part.

Short notice, but I will call a few CQs tonight at 9 PM eastern, somewhere around 3570 to 3575 Kc. using the TNT. Please be patient with me as I must get up and move to reach the receiver for any adjustments needed.

This will be a one night operation as I must remove the table with the rig & filament & plate supplies in the morning. I still do not have the permanent vintage operating desk finished.

I set up the TNT this evening to test another tube. It behaves identically to the other so I now have two good '10s. I'm one happy BUG!

This business of not being able to reach the receiver must be dealt with sooner rather than later. I need to build, buy, beg or otherwise procure a receiver for the vintage operating position ASAP.

73,

That's it Paul,
On the cover it says "For the Beginner" with a photo of the regen.

I built that receiver about ten years ago and I'm thinking I used a vintage
50k pot.

I just added photos of my version in the photo album section here.
See John_kb7nrn/Nov 1929 QST
RX<http://groups.yahoo.com/group/AWAGroup/photos/album/1603696260/pic/list>

I dressed it up a little and did away with the tapped coil, went with plug in
coils. Added a front panel and nice vernier dial.

John

Is that receiver in the Nov. 1929 QST? Titled "For The Beginner"?

Hi John,

It is from Nov. 1929 QST. However the title is "A Simple 1750 and 3500 Kc Receiver". There
may have been more than one receiver article that month. I'm not sure.

If one winding is still good on your transformer, you can use it for impedence coupling. I've attached a file but I don't know if it'll come through.

Two votes so far for trying to get it running. I admit the thing has a certain appeal to me, which I cannot quite explain! If I had tubes I would definitely make the effort but don't think I can justify the expense on a radio I'm told doesn't work. I poked around a little and the only problem I can see is an open primary on the audio transformer between stages. It does have a headphone jack at the detector output so that stage could be fired up alone. I have not hacked into it yet and will leave it be for a while. Maybe I will get the urge to buy tubes for it.

The grid leak on the detector stage is (to me) and odd device. It appears to be a rotating (carbon?) disc with contacts, totally exposed. Its range is from almost nothing to around 280 K ohms. That seems very low resistance for a receiving leak but I am not familiar with the requirements of the '99 tube. Comments?

Subject: [AWA Group] On the air tonight

Short notice, but I will call a few CQs tonight at 9 PM eastern, somewhere around 3570 to 3575 Kc. using the TNT. Please be patient with me as I must get up and move to reach the receiver for any adjustments needed.

This will be a one night operation as I must remove the table with the rig & filament & plate supplies in the morning. I still do not have the permanent vintage operating desk finished.

I set up the TNT this evening to test another tube. It behaves identically to the other so I now have two good '10s. I'm one happy BUG!

This business of not being able to reach the receiver must be dealt with sooner rather than later. I need to build, buy, beg or otherwise procure a receiver for the vintage operating position ASAP.

Paul,

That is a typical, early '20's homebrew receiver it is built as good as any I have in my collection.

The tuner is a tapped bank wound solenoid on a mud tube, One might get up to 2 mhz as it is but I doubt it will get to 80. There is too much lossy dielectric to get past that in the coil form, variometer and variable condenser. Even if the turns were stripped (shame)... I think that it is a commercial coil...

Frankly, I would only use the sockets and the panel if it is hard Bakelite for a shortwave receiver... Better off trading it complete for the parts you need for a Reinartz rig or a mock-up of the SW-3 circuit. A Reinartz is easy, fast and damn few parts.

http://www.antiqueradio.com/reinartz_01-99.html

There are construction variations including coil isolation.

The grid leak should be anywhere from 2 meg to 8 megs, depends on the tube. Rule of thumb is raise the grid for sensitivity, too high and the radio will motorboat. Too low and it will be insensitive. All while experimenting with filament and B+ voltage... Once values are found keep until tube is changed out...

12 to 22-1/2 volts B+, 45 for the amp.

Do get creative and install a sheet of tin from an olive oil or thinner can behind the panel to stop hand capacity effects. Leave it out if you like going nuts tuning...

Any 20's 3:1 audio will work, should be able to find one for $10-$15...

It may, be possible to build Reinartz in same box and re-use all panel holes. Use a metal frame variable condenser, coil will use the tap switch and potentiometer or varable condenser will replace variometer. Sell (or swap) variometer and other parts to get tubes, dcc wire and audio transformer... Keep audio amp as is, maybe even build a two step :) or push pull for loud speaker...

BTW vintage P.P. transformers are very hard to find...

Thanks everyone for being on!

Called CQ a few times, heard nothing til Lou called me. TNX Lou, beatiful 578 signal on a quiet band. After working Lou, tuned a little higher and heard K4JYS in QSO with a KE4. Listened for about 30 minutes, then fell asleep at the rig. Glad I didn't do a nose dive into the TNT with 320V on it! Rig might need to be fitted with a BUG guard, hi hi! Bill was 558 at first and slowly building, 568 before I fell asleep. This on a 'compromise' rx antenna. The one most favorable to Bill is down. Darn beavers again, no doubt!

Don't know why but this time there seemed to be RF getting into my temporary high tech modern power supply and causing the voltage to drop. Darn fancy technology can't handle a little RF! Pretty sure that's why I had some chirp. It didn't happen last time. Might have something to do with how wires are routed on the table. Ah well. I will surely have some voltage sag when I get the 20s/30s supply built.

Noticed again I had only 150 mA RF into the antenna while I'd had 230 mA into a perfect 50 ohm resistive load. These readings are both taken direct from my resuscitated 500 mA Westom 425 meter. Real RF current would be about 25-30% higher, I think. Will check meter and try to confirm how much it is off. Will also take some impedance measurements on the antenna.

Hi John,

Thanks for the info and thanks for sharing photos of your FB receiver!

My plan is to duplicate it "fairly close" to the original and style it to sort of match the TNT, which the original pretty much does.

One change I am thinking of making is to tap the tickler coil so it wouldn't need such a wide range regen control to cover the two bands. At least I have a theory that could work.

I also need to modify it to work with my antennas.

I have a vintage (but surely not 20s and probably not even 30s) Clarostat 250 K, N taper (regen) potentiometer I could use. I hate to use something that new if I can avoid it.

I also have that 300K old potentiometer in the homebrew radio I was given, if I could convince myself to cannibalize it.

Thanks again for sharing. How well does this circuit work?

Check your RFC Paul. I had the same problem with my MOPA rig. I substituted a modern pi-wound choke for the wire-wrapped dowel and solved the problem. To keep things '29, I either need to wind a bigger dowel type RFC, or use a commercial RFCs from the era.

It was probably harmonics that was causing the SWR to be high, then. By moving the link to the (presumably "cold") end of the tank coil, you retained inductive coupling while reducing the capacitive coupling component. Capacitive coupling passes more harmonics since capacitive reactance is inversely proportional to frequency.

Glad you got 'er fixed, Don!

I tend to agree with Mike. I know that's what I'd do. If this thing was built back in the day, it's a one-of-a-kind piece of history, and I'd be inclined to let it live. And I get a lot of fun from hooking something like that up and using it, pondering when the last time it had been used might have been.

I guess a lot would depend on when, and how badly, i needed a part from it.

Ultimately, though, it's Paul's radio, and it goes without saying it's his decision to make.

In that case, I would think a pot with a maximum resistance of between 10K-50K should do the trick.
(The smaller the finer control of regen, but the maximum resistance needs to be high enough to stop the detector from oscillating).

A work around might be a ~50K resistor across the open primary, and couple the plate lead from the primary to the grid lead of the secondary with 0.01uF.

nominal 3.0VDC filament (two dry cells in series with rheostat). I run the filament voltage lower, as long as the tube is still doing its job, to save the filament. I'd put ~25V B+ on the plate in detector service. The 280K variable grid leak seems low, my guess is it's got a problem. I would think you'd want something in the 1 - 5 megohm range.

I have a homebrew single- UV199 regen set built by my grandfather ca. 1921-22, I oughta post an image of it. I fire it up during the fall/winter months for some nostalgic BCB DXing.

Hi Paul,

Just getting to sending you a report. I just could hear you...maybe 339(not really strong enuf to give a good tone rpt) and think a small amt of chirp. At least you are getting out. Not bad for a couple of watts input. That area of the band was pretty clear. I was called by a stn I hadn't worked in a good while so we went up and had a 45min or so QSO. Also heard Lou, maybe 44-55. I will probably be on some more prior to the '29 party and will hang around 3.570-80kc. Tnx to both you and Lou for the rpt of my sigs. I'm sure we'll work so lets keep plugging.

Check your RFC Paul. I had the same problem with my MOPA rig. I substituted a modern pi-wound choke for the wire-wrapped dowel and solved the problem. To keep things ’29, I either need to wind a bigger dowel type RFC, or use a commercial RFCs from the era.

Thanks Steve, that is interesting. If this problem occurs next time I have the rig set up, I will try temporarily clipping in a larger choke and/or a bypass condenser between B+ and B-.

I have given some thought to whether the original recommended chokes were really adequate but never arrived at a conclusion.

The original TNT article suggested winding 2 inches of either #38 d.s.c. or d.c.c. on a one half inch form. By my calculations, d.s.c. would be roughly 170 uH with an inductive reactance of 3740 ohms at 3.5 Mc., while d.c.c. would be 78 uH / 1715 ohms. That sure doesn't seem like much but then again they did have it at the cold end of the plate tank.

My choke is about 2200 ohms and I do have it at the cold end of the tank.

Hi Chas,

Thanks for all the information.

I think I need to test this receiver in its present form before I make any decision regarding its fate. I thought I could take it apart without knowing, but I'm finding I can't! Someone built this way back in the day and I'm sure it has a unique story. Who am I to rip it apart without even knowing if it has life left in it?

It will most likely be some time before I get around to buying tubes for it, but until then I will clean it up a little and find a spot to put it.

Paul N1BUG

On 10/26/2011 09:54 PM, Charlie wrote:

Paul,

That is a typical, early '20's homebrew receiver it is built as good as any I have in my collection.

The tuner is a tapped bank wound solenoid on a mud tube, One might get up to 2 mhz as it is but I doubt it will get to 80. There is too much lossy dielectric to get past that in the coil form, variometer and variable condenser. Even if the turns were stripped (shame)... I think that it is a commercial coil...

Frankly, I would only use the sockets and the panel if it is hard Bakelite for a shortwave receiver... Better off trading it complete for the parts you need for a Reinartz rig or a mock-up of the SW-3 circuit. A Reinartz is easy, fast and damn few parts.

http://www.antiqueradio.com/reinartz_01-99.html

There are construction variations including coil isolation.

The grid leak should be anywhere from 2 meg to 8 megs, depends on the tube. Rule of thumb is raise the grid for sensitivity, too high and the radio will motorboat. Too low and it will be insensitive. All while experimenting with filament and B+ voltage... Once values are found keep until tube is changed out...

12 to 22-1/2 volts B+, 45 for the amp.

Do get creative and install a sheet of tin from an olive oil or thinner can behind the panel to stop hand capacity effects. Leave it out if you like going nuts tuning...

Any 20's 3:1 audio will work, should be able to find one for $10-$15...

It may, be possible to build Reinartz in same box and re-use all panel holes. Use a metal frame variable condenser, coil will use the tap switch and potentiometer or varable

condenser will replace variometer. Sell (or swap) variometer and other parts to get tubes, dcc wire and audio transformer... Keep audio amp as is, maybe even build a two step :) or push pull for loud speaker...

BTW vintage P.P. transformers are very hard to find...

OK Larry, thanks. The original receiver used a fixed tickler coil for both 1750 and 3500 Kc operation. I guess I assumed it would take a pretty high range potentiometer to control regeneration on both bands with that. However I am thinking about modifying it with a tapped tickler coil which, if it works, may negate the requirement for a very wide range regen control.

Hmm. Probably not ideal for this application, but I have a Bradleyohm which seems to span the range from roughly 4 K ohms to a bit more than 50 K ohms. It will go much higher but becomes a bit squirrely above 50 K.

Balanced line/tuned feeders, 'cuz it'll make your antenna useful on the fundamental and up within the MF/HF range. (You can even in a pinch use an 80M dipole on 160M, or a 40M dipole on 80M., etc.: not the best way to go, but it will get you a signal on the band.)

For coax, up to 60 MHz at medium power RG-8X is fine, assuming a reasonable VSWR.

You may be able to get the set to play on 160M with that variometer.

If the minimum inductance is low enough, if may go higher in frequency, but the regen adjustment might be too critical to be useful even if it works.

Hi Guys,

Speaking of 160-meters, I finally got my antenna farm partially "re-habilitated" this week---enough so that I can at least get on the air---and made with a few CQs in the early hours before sunrise to-day...

There was absolutely NOBODY on the air below 1815-KHz...and the 2 or 3 stations that were calling CQ DX, were above 1820-KHz. It's prime time, guys! Nobody around to squawk about prehistoric signals, no critics, NO NOBODY!

Is anyone else up & about at around 0900Z...? Or am I the only nut job who is an early riser...?! : >)

I got my other 45 yesterday . I have begun perfoming its s-x change operation so I can use it in bayonet type socket. Just need make the pin and install it with JB weld. Tube was $20. I was happy with that. I wonder what a 45 will handle for plate voltage. 400 maybe? I am running 287v key down now.
Yes i believe it was harmonics too. I was thinking because the link coil was larger (more Q making it dominant)and just happened to be tuned to a harmonic of the original freq (accidently) it was taking over . The more reverse power I had the more it wanted to. I may be all wet there but it was that thinking that helped me sort it out. I have the link on the high side currently as it didnt like the link down on the ground end but maybe with this coil it could live with it. I will whip up an Rf flashlight bulb link and see if it likes that. I have had it on a bit around 7037. No joy yet. I give it a shot every night. Maybe I should get up early and try the morning thing. Anyway thanks everyone for the tips help and encouragement. Nice to see the SWR bouncing merrily below 2.

This morning I just finished making up this meter panel, which I then attached (after taking the photo) to the bench where I operate my 1920s/30s stuff. This will be used to monitor plate voltage and current for all my homebrew single-tube transmitters (TNT, Hartley, Tri-tet). So now I have no excuse for not running exactly 9.999W in the BK! :-)

The two screwdriver pots are to calibrate the voltmeter on the 600V and 300V scales; the toggle switch chooses between the two scales. There is also an "ohms" scale on the meter which I obviously won't be using; it must have been removed from a VOM.

Before the BK I have to fashion a reduction drive for the condenser in the TNT, it's just a solid knob. I'm thinking a grommet on a shaft to drive the outer rim of the knob skirt will do it. I have a National type "A" Velvet Vernier but it would stick out in front too far and look weird*. I also need to wind up a 40M grid coil for the TNT -I already have the plate coil done - as this year I want to use the TNT on 40M and the Hartley on 80M. This is opposite of what I have done in the past. It was difficult enough getting the TNT on frequency on 80M without a reduction drive; moving it to 40M will make it an absolute necessity.

*Since it's a PP TNT, the rotor frame, and shaft of the condenser are hot with RF, and I'd want an insulated coupling between the Velvet Vernier and condenser shaft.

This is the last image I'll post for a while; promise!

I hope not, Mike! :-)

I just found "vv cephei" in my Google search field in the browser, and
"qqq" in the url field. No kidding!

In his younger days this same cat walked across the keyboard of one of my
boy's laptops and somehow hit a sequence of keys that inverted the display
180 degrees! It took a phone call to Gateway to get that straightened out.
Another time, the same cat tried jumping up from the ground onto my son's
desk, encountered that same computer, and managed to scratch half the keys
of the keyboard on the way down. Luckily we had bought a maintenance
contract that included accidental damage; they sent me a replacement
keyboard which I installed for him.

You'd think I'd learn to close my laptop when leaving it unattended by now...

I think it may be KF4TAP. Larry said he goes by Keith even though it's not his given name. Check out his listing on QRZ.com. I'm familiar with that call from somewhere, though at the moment I can't quite recall where.

Chas,

THANK YOU for that link to the repro beehive topic on Antique Radio Forums! I have registered and subscribed to that topic.

I also see a lot of other VERY interesting stuff there. I know I have landed on that forum a few times while searching for information on the web but someone never found some of the best stuff there. This is great.

Follow that thread. I suggest joining the forum and register your email address for updates. The original poster with help from another are well along the way. Materials and the process have been discussed at length and everyone seems to be aware it is not a slam/dunk project but is very do-able...

That's the dude!

He posted a link to images of some of his "prototype" beehive insulators
on Glowbugs last year or earlier this year. They were white ceramic
unglazed, and was working on glazing them in white, brown, and cobalt
blue, IIRC.

Someone who needs insulators should fire an Email off to him and ask him
about the project and availability.

Marc Ellis posted on the "other" AWA list that they just went into the mail, and they are not sending them 1st class anymore stateside. Not sure if that includes Canada. They must send them first class overseas, as a bulk rate option isn't available, and someone in GB (IIRC) has already received theirs.

Good thing you didn't ;-)

My type of humor, though - I like it!

> Anyway ths mode is not something to shaway from it is fairly easy to do.
> Now that I have a spare 45 I may push this one a bit. voltage wise.

George Shuart ran them at 400V in his PP TNT, and George Grammer ran 'em even higher in his. (The actual DC voltage may be buried in the article, but Grammer specifies a plate transformer with 350-400V either side of center-tap with a capacitor-input filter. Do the math; I doubt resistive losses would bring the output down to 400V).

Be careful, though, they're not like Doritos: they're not making any more.

It's has been an interesting run of posts today. Fall is here...

Some may recall that Pat, G3IKR/AWAGroup (SK) acquired a much UK modified REL 175 transmitter. Pat began the restoration and I now have it to carry on with. There is only one real problem with the restoration, a cracked Jewell metre lens. So....

Does anyone have for sale or trade a like metre that I can use the shell/glass for a replacement? If it requires repainting , no problem, I'll send it to Paul.

Wt sa?

Lou

The required bit is the portion of the metre from the front and back 7/8".

From: Don
Topic: 3968 Message: 3968

I just popped the new 45 tube in. Much better tube!
54 mils at 228 key down. Voltage is down to 228 because I needed some regulation and found a way to do it easily. TX sounds better on my rxs More solid. I guess I am over the limit input wise . I am tuned up on or about 7030. May give it a shot in about 10 minutes or so before turning in. Old tube no other changes was about ten mils less. This one keys solid or solider if there is such a word. I am almost tempted now to buy a brand new one. NOS if possible.

My own RFCs are 2 inches of #31 (~.0091□) DSC on a ½□ dowel. They measure 70 to 80 uH and 3.3 to 3.4 ohms. I am using them as shunt feed. Probably not enough inductance anyhow.

The 1931 ARRL handbook has chart on page 113 based on #38 DSC.

Hi Lou,

You can still buy Hammond chassis from Electro Sonic Supply---although they now ship from Buffalo, having closed-up the big warehouse they had in Toronto...

I bought some from them about a year & a half ago---arrived in just a coupla days, too, with no duty / Customs / etc. fees attached.

3978. [AWA Group] Finding Parts

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-28 16:44:20 UTC
From: RadiosRUs
Topic: 3978 Message: 3978

I am new to the reflector and really new at building ' "old tyme radios". While not a stranger to a soldering iron, as all of the fingers on both hands have been burnt or blistered at one time or an another, the re-creation of radios of the past is very exciting. But the other challenge is where to find those parts (hmmm Mouser doesn't seem to stock what I am looking for) and what does one do in the interim.

I have been collecting parts for a long time and am getting closer but still do not have everything for a complete re-creation of a Rx or Tx. So I have been looking for some interim solutions especially for power supply parts. I ran across something that may be of interest to others who like me are waiting for that next listing on ebay or super find at a garage sale or better still a swap with someone on the reflector.

The find is a linear power supply (notice I didn't say switching power supply) rated at 5 VDC at 4 amps. As a bonus there is 12V at 100 Ma on the same supply. The price is $10.95. I found this in the Marlin P Jones catalog mpja@... It is item number 15347-PS.

With the supply I will be able to at least light up some filaments. With an LM317 regulator and external pass transistor I should be able to do 2.5 volts at 4 amps. So this for me removes one hurdle to getting something working until I find the proper original 1920-30's filament transformer. With DC on the filaments that should make for less hum on a Rx. Also with the LM317 fitted with an adjustable pot that should work for "the old rheostat in the filament circuit".

Sorry for the bandwidth. Just wanted to share some info and perhaps also get some feedback that what I proposed is not a good idea.

I am making a stouter Power Supply. I have an old AC radio transformer from an old tube set. It is about three times the size or more of my current one so i am thinking it will handle more current and give les voltage swing if i build the rest right. I tested all the windings and centre taps. It is good. Doesnt stink either wich is always good. It has a marking 246X60 in black stamped ink on it. I have a Hammond on my current suooly. It has a 271X60 on it. I assume because of the similarity of the numbers this old one is a Hammond too. Anyone have a listing? Voltages and such?

You can still buy Hammond chassis from Electro Sonic Supply---although they now ship from Buffalo, having closed-up the big warehouse they had in Toronto...

Twas a dark day after I found out that ES was no more... Felt old!

Don. I found something in a 1935 copy of the Hammond catalog that might help. Apparently the 246 came in 2 versions, th "X60" for 60 Hz and the "X25" for 25 Hz. The specs are listed as follows:
100W, 370-370V, 5.0V @ 2A, 2.5V @ 10.5A, 2.5V @ 1.75A. This all assumes that this is the transformer that you have.

Leonard

Thanks. You know that should be enuf for this rig. Maybe I should just calm it down some. key up voltage is sky high . It is an old ampfier and neighbour gave me. Some homrbuilt thing. The PS is fairly quiet. I need a load resistor for starters. Stuff like that is hard to find nowadays. I am using the 6.3 volt winding through a Vintage reo. I setthe filment voltage with a voltmeter. Actually I can come with in a few points by watching the colour. Since I am never using the amp I may just change this over to a good PS. dint relize it had a 60ma rating.. It should be more than enuf for these ! tubers.

Leonard! Your the man! Thanks. It came out of a radio with 56 tubes so the voltages are right for heaters. I didnt realize they used 370 Ct transformers back then. 370-380 Dc key down volts does have a nice ring. I have the power choke too. I will fix the one I am using that Steve gave e specs on and rework my transformerless supply for this Transformer. I have a few nice 80 tubes too. Nothing like that soft glow!
Thanks all

Hi Don,

Sounds like you've solved the transformer question there without my help...!

Do you have a copy of the FIRST edition of the ARRL book UNDERSTANDING AMATEUR RADIO? If so, have a look near the back of it---there's a very nice one-page write-up on how to ID power transformers in the absence of any spec sheet, i.e. which leads are the main power leads, filaments, etc. etc. I power-up transformers under initial "investigation" here through a 10 volt AC supply, to safely minimize the voltage being measured from the secondary. I then multiply this measured secondary AC voltage by 12, then deduct 20% as a "no load" factor, in order to come up with a "...best guesstimate" as to its potential...

Works for me...!

Paul and others, I have not received my copy of the Journal yet so I don't know what it says about the BK. Tim and Marc informed me recently that the Journal will no longer announce the BK 1929 with the one or two page write up that John Rollins and then I have been doing for many years. The purpose of that write up was to not only inform you guys of the event, the rules, the dates, etc, but also to create interest from new members and existing members. I was told that only dates will be announced now in the Journal and you have to go to the AWA website to find out the details. I was told that the results will be published in the Journal but none of the text or discussion article.

I don't agree with this plan but I was not consulted on it either. I know two MN members who rely on the Journal because they don't have computer access. It's still a mystery to me why less Journal space is allocated to an event that generates so much activity within the AWA. Besides the Conventions, I wonder what other AWA event has 50-60 AWA members participating over 2 weekends, and doing the "wireless" part of the AWA.

I have to complete the 2011 BK write up this weekend that will go on the AWA Webpage. I'll also post it here.

On 160m, I was informed by Tim that 160m is in for next year. Again I wasn't consulted, just told, so don't yell at me. As for where on the band we should operate, I imagine that's up to us. I know several of the 1929 BK guys like VE3CUI are big into 160m so we'll look for their advice.

What about the 40m frequencies this year? We started talking some about operating above 7100 since t he 7040-7060 segment is a mess. Should we just move the whole shebang up above 7100 or advertise both? I listened up there last year, didn't hear anyone although I know several contacts were made up there, and agreed that the band is alot quieter and without the digital, rtty, high power cw, ssb . Meanwhile, the 3 KW RTTY signals and 2KW CW signals on 7040 aren't... hi hi

This is the first time I've tried to attach a photo. Don't know if it'll work. This is the shack being remodelled. Everything has been removed and jammed onto backroom shelves, and I mean everything. There isn't a single resister left laying around. All the antenna cables have been cut and rerouted. I'm hoping to start setting up the shack again around mid November.

A while back I was trying to find references to pre-1930 push-pull TNT designs.

If you look the article for the single-ended TNT ("single control" rig in that issue of QST (Dec. 1929), there is a note on the lower right corner of the first page in the article that references a push-pull "single-control" rig in the "September issue.." I had looked for that article in the September 1929 issue, no joy, then started going back to earlier Septembers, and still couldn't find it. So all I have at the moment to support my claim that the push-pull TNT is indeed from the 1920's is that note in the Dec. 1929 issue.

****

What an absolutely STUPID move that is...!!!

No, it goes beyond mere stupid---it is arrogant and IGNORANT of the fact that more than a few of the current AWA members received their very first taste of vintage radio by way of the 1929 QSO Party.

I dare say, if such a thing were even remotely possible, Bruce Kelley would be spinning in his grave at such news. It runs counter to the esteem that he held Amateur radio in, celebrating its glorious past. SHAME ON THE PERPETRATORS WHO HAVE COMMITTED THIS TRAVESTY AGAINST HIS LEGACY. You have committed a mis-justice against his memory, Amateur radio, and indeed, the very future of the AWA.

UM, I dont need the voltage. I have been to hartley school overnite. Read re read studied thought.. In my 1940 Radio book it said DONT put the like at the hot end. I could get it to oscillate before atthe clod end and so i did what worked. HOWEVER (big word!) I thought "if they can make it work what am I doing wrong?" They suggested using stiff houshold wire for a link and play with it. I unhooked the hot side and wound a quick coil from some white household wire. I scotch taped it together and hooked my antenna feed to the power meter and ant to it. I got some more power but I moved it around. Got more. I notice that the set made considerably better power higher on the band (7100 plus.) .I treid my inverted L I put up last week. It was on the long side.(Tree didnt grow in exactly the right spot but awful close) Same deal. Also if I dropped freq and overcoupled "poof" Osc would quit. I went and cut some wood thinking about this . When I came back in I moved the cathode link one turn north (to B+ end) Woops! Now I can't join the party till after midnight. Power is up over 15 times my best yesterday even with my voltage down to 228v with my makeshift regulator in place. I did at one point see a 20 W on the meter but maybe it was just a bounce.;>). I am making an new link for the proper end I have also fabbed a way to make it adjustable from the front panel. I am getting there bit by bit. Am currently tuned up on 7030 andwill pnd a bit of brass from time to time during the afternoon. I am curretly showing just under 15 watts on the meter as is in the picture.
Now I wonder if that is what is what is wrong with my AM set. I know this is old hat for some but for others like me later on it may help them sort out their problems.

This is, in my opinion, absolutely unacceptable. It also clearly reveals in which direction the new leadership wishes to take the AWA...seemingly as far from Amateur Radio as possible...what else could this gradual scaling-down of amateur radio activities indicate?

I think we ALL need to voice our disgust at the loss of bulletin write-ups and the obvious lack of input from members when it comes to making rule changes. I will be sending e-mail to them today.

Unfortunately amateur radio seems to be seen more and more as a pain-in-the-butt for some organizations, especially if there is a small profit margin...even our own Industry Canada licencing authority has been trying to pawn off the entire program to RAC, our equivalent of the ARRL.

Hello group--

While I shouldn't speak for Tim, I believe that he went to a "bare bones" listing of the ham events because he wasn't able to get the more detailed information from the event managers in time for the deadline I had given him for the October issue.

I realize this seems ironic in view of the lateness of the issue. That comes from the fact that we have switched over to the non-profit mailing mode at considerable savings.

I am surprised that only the first class mailings to non US addresses seem to have arrived - all mailings were made on October 20.

In view of this problem. I'll shortly send out to the group pdfs of the actual ham readio column from the October issue. Watch for them in a half hour or so.

Marc

Topic: 3957 Message: 4011

To the group--here is the complete copy from the October ham column. I had intended to send as a pdf but then I realized that attachments are not allowed in Yahoo groups. So here it is as part of a mail message.
I was glad to hear that one of our issues made it to Wisconsin, at least . I'd appreciate hearing from other US members who have received their issues.
Best--
Marc Ellis

]HAM
COLUMN -- OCTOBER 11

Greetings to all!

. Things have been a bit rough here since the
conference with computer failures and other minor problems. To catch up
we are including the following listing of our four major events for 2012 as
well as a reminder for this year's Bruce Kelly Memorial in December. If
you need details on the contests, or log sheets, please go to the website where
they will be posted about a month before each contest. If you cannot
access the website, send me a note and I will copy them for you. Be sure
to include your address in your letter!

At the Amateur Hour during the Conference it was suggested
that we expand the BK to include 160 meters. That seems very logical as in
the 1920s most of the hams used 160 and it is somewhat easier to generate RF at
those frequencies. Thus we have followed this suggestion for 2012. So
wind up the coils and pad out your condensers and we'll see you on 160 next
year.

73, Tim

EVENT: 2011 AWA Bruce Kelley Memorial CW
QSO Party

DATES: Sat. Dec. 03 @ 2300 GMT to Sun. Dec.
04 @ 2300 GMT

and
Sat. Dec. 10 @ 2300 GMT to Sun. Dec. 11 @ 2300 GMT

Bands: 80 and 40 Meters

Special Conditions: Contest is for those who design and build low power self
excited oscillators (no crystals!) from the 1920s. Design must predate 1929 and
use early tubes. Construction to conform to design using the earliest parts
available. Receivers: old is better, but not required. High scorers should send
in full details on equipment design and station photos. Logs are due four weeks

after event.

Plaques to be awarded

EVENT:
2012 AWA Linc Cundall Memorial CW Contest

Dates:
Wed. Jan. 18 @ 2300 GMT to Thu. Jan.
19 @ 2300 GMT

and Sat. Jan. 21 @ 2300 GMT to Sun. Jan 22 @ 2300 GMT

Bands: 160, 80 and 40 Meters

Special Conditions: Contest designed to favor those using low power and equipment constructed before 1946 with straight keys.

But, all are welcome. High scorers should send in full details on equipment and station photos. Get that WW II surplus on the air!

Logs are due four weeks after contest. Plaques to be awarded

EVENT: 2012 AWA Amplitude Modulation QSO
Party

DATES: Sat. Feb. 18 @ 2300 GMT to Sun. Feb.
19 @ 2300 GMT

Bands:160, 80,
40 and 20 Meters

Special Conditions: AM is required. All ages of equipment and all power levels. Extra credit for working one or more Flagship Stations, typically W2AN (James Millen's personal xmtr.) and W1HRX (Millen's personal call). Logs due four weeks after event

EVENT: 2012 AWA John Rollins Memorial DX
Contest

DATES: Wed. Mar.7 @ 2300 GMT to Thu. Mar. 8
@ 2300 GMT

and
Sat. Mar. 10 @ 2300 GMT to Sun. Mar. 11 @ 2300 GMT

Bands: 40 and 20 Meters

Special Conditions: CW contest designed to favor those using equipment constructed before 1960 with straight keys. But, all are welcome. High scorers should send in full details on equipment and station photos. Logs are due four weeks after contest.

Plaques to be awarded.

EVENT: 2012 AWA Bruce Kelley Memorial CW
QSO Party

DATES: Sat. Dec. 01 @ 2300 GMT to Sun. Dec.
02 @ 2300 GMT

and
Sat. Dec. 08 @ 2300 GMT to Sun. Dec. 09 @ 2300 GMT

Bands: 160, 80 and 40 Meters

Special Conditions: Contest is for those who design and build low power self excited oscillators (no crystals!) from the 1920s. Design must predate 1929 and use early tubes. Construction to conform to design using the earliest parts available. Receivers: old is better, but not required. High scorers should send in full details on equipment design and station photos. Logs are due four weeks after event.

Plaques to be awarded.

EVENT: 2012 AWA Bruce Kelley Memorial CW
QSO Party

DATES: Sat. Dec. 01 @ 2300 GMT to Sun. Dec.
02 @ 2300 GMT

and
Sat. Dec. 08 @ 2300 GMT to Sun. Dec. 09 @ 2300 GMT

Bands: 160, 80 and 40 Meters

Special Conditions: Contest is for those who design and build low power self excited oscillators (no crystals!) from the 1920s. Design must predate 1929 and use early tubes. 4012. Thordarson TR-91 transformer

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-29 17:30:42 UTC
From: Dan
Topic: 4012 Message: 4012

Good morning all:
I am looking for the data sheet and/or the schematic for the Thordarson TR-91 power transformer. It was designed as a DC/DC inverter transformer using a push-pull design with transformer feedback. Output is 450 volts at 120 watts. Any assistance would be appreciated. Some dimwit (me) lost the data sheet.
73,
Dan - W7OIL

PS: As of 1 December 2011 I will be changing my email to dan.w7oil(at-symbol)gmail.com

Hi Marc,

Surprise! This particular Yahoo Groups reflector allows attachments! There have been a flurry of messages even today with jpegs attached, and one a bit ago with a .doc file attached.

BTW, no Journal yet here in Maine (I was hoping it would be in today's mail, no joy).

Hi Roger,

As I read it, it's not a restriction, just a scoring advantage.

But if you'd like to give input you need to talk to W1GIG, Tim Walker, who
is not on this reflector, or the event coordinator for Link Cundall,
whomever that may be.

Notice that the LC summary below also does not allow for current homebrew of pre-1950 designs.

Last year I quizzed Mike Murphy on both issues. The official LC rules (revision 2) he emailed to many of us on Dec 28, 2010 made no mention of straight keys and allowed for "recently built to the typical designs of that era".

Hello all,

Thanks all for the feedback on the new W1UJR website, most helpful!
Delay in my reply is that most of my AWA correspondence goes into an email folder for later reading. New format will be a combination of the old layout, and a blog for updates, a elegant mix of the old and new. Blog will be menued off the more "static" site.

Have a very interesting article in the next "Transmitters" column of the Journal, you fellows on this list are going to love it!

Cordially,
Bruce J. Howes

Marc - In recent e-mail to the group, Scott has indicated that there will no longer be any detailed contest description pages nor will there be the usual 'after contest summary / soapbox pages', merely a list of scores.:

" Tim and Marc informed me recently that the Journal will no longer announce the BK 1929 with the one or two page write up that John Rollins and then I have been doing for many years. The purpose of that write up was to not only inform you guys of the event, the rules, the dates, etc, but also to create interest from new members and existing members. I was told that only dates will be announced now in the Journal and you have to go to the AWA website to find out the details. I was told that the results will be published in the Journal but none of the text or discussion article. "

Can you confirm (or not) if this is truly the case and that these contest activity discussion pages will no longer be part of the Journal?

Thanks,

Steve

Cheapest way to buy them is buy an old radio. You may have to pay $50 to $75 at a flea market but most have at least 6 tubes. Often one is bad but the rest are good. SO if you get 5 good ones for $60 you are way ahead of the game plus you have all those spare tube sockets and cardwell type capacitors. Occasionally you might even find a fuse type gridleak. Such a deal! Speaking of old radios I now have a decision to make. I have my Hartley working pretty good. (Sounds like one of those Austrailian instuments (digggerydoo?) on my monitor rx). I was going to take is apart and sand and varnish but I have kinda got to like the old patina the piece of Mahogany has. I think it would lose some of its charm if I made it too pretty. Still thinking.

Marc,

I, too, would like clarification on this very same point...

I fail to see the wisdom & logic in terminating a feature of THE AWA JOURNAL like this that so many of us eagerly anticipate after the 1929 QSO Party---especially in light of the fact that you yourself periodically urge members to submit articles such that the JOURNAL might have substance in it! Is there such a tremendous backlog of articles on-hand pending publication in your file that you've simply run out of room for any summary / soap box / etc.?

Somehow I doubt it.

One of the reasons that I terminated my allegiance to the ARRL some 10 years ago was the fact that the League ceased publishing extensive contest results in QST of the various on-air events that they sponsor, re-directing members to, instead, buy a subscription to their NATIONAL CONTEST JOURNAL: I see history repeating itself here, with the folks running AWA encouraging us all to view detailed write-ups of AWA contests on-line...

Well, the truth be known, (A) in the ARRL's instance, not everyone has the disposable money required to take-on yet another magazine subscription, and (B) as for the AWA, not everyone owns a computer, or has on-line access.

And finally, (C) even though I really & truly do value my AWA fellowship, I won't hesitate to allow my membership with it to lapse as well, on principle. For some strange & twisted reason(s), surely known only to the directorship, the AWA seemingly wishes to dis-enfranchise itself with Amateur radio operations. What a foolish direction to be taking, in light of the demographics & reality of a situation that forces many to look down upon us as being little more than "...a bunch of ancient geezers playing around with old radios."

Events like the Bruce Kelley affair go way beyond that image IMHO, and instill a real & vibrant life to our radio antiquities, to say nothing of attracting potentially new members

to the fold. Why then would the AWA powers-that-be deliberately plot a direct course to obsolesence such as they are doing with this "edict"...? I'm afraid that it is beyond my comprehension...please clarify.

First: As for amateur radio content in the journal being cut back in any way, I must say as a new member whose interests lie almost solely in the amateur radio arena, I'm very disappointed. Frankly I joined mostly to get access to amateur radio content in the Journal and now I find it is being cut back? In all honesty if that's true I probably will not rejoin next year. It would seem for me there is nothing to be gained by being a member.

As for where on the band we should operate, I imagine that's up to us. I know several of the 1929 BK guys like VE3CUI are big into 160m so we'll look for their advice.

We have a number of 160 meter stalwarts in this group and I would certainly like to hear their thoughts.

160m is and has long been and continues to be my primary band of interest. Last time I commented on 160 meters in the BK it obviously upset and offended some for whom I have the utmost respect, admiration, and gratitude. I won't dive in again unless my opinion is specifically sought, but I will say 160 meters is not quite like any other band. I believe there are several important factors to be considered in choosing where in the band to operate with antique gear.

What about the 40m frequencies this year? We started talking some about operating above 7100 since the 7040-7060 segment is a mess. Should we just move the whole shebang up above 7100 or advertise both?

I'm not sure this will be any more welcome than my comments on 160 meters, but in my opinion 7040 to 7060 is practically useless. I think we would have more success above 7100 and would suggest we just concentrate on that segment. Bear in mind however this comes from a newcomer perspective and may not take into account any historical considerations or potential difficulties getting the word out to all participants.

That is my $.02 worth, though its actual value is no doubt considerably less than that. Your mileage may vary. No warranty expressed or implied. Void where prohibited.

Hi Paul,

For starters, I haven't been privileged with hearing your usually big signal on Topband yet this year...! I just got on the band myself here this week---still just using the one single "L, with hopes of getting the phased system working again sometime this week...

I mentioned to Scott that not too many years ago, AWA actually had a separate 160-meter QSO Party that it sponsored in (I believe) January. Maybe that would be a viable option to prevent the 1929 QSO participants from "...spreading themselves too thin" all over the low-band spectrum (our numbers are not that large to begin with!). In any event, I would STRONGLY suggest that operations there be limited to the 1800- to 1810-KHz segment: if you go too much higher than that you'll drive DX'ers absolutely bonkers with QRM---and DX'ing seems to be "...de riguer" with the Topband crowd anymore. Nothing else much matters, not even rag chews. Believe me...

I also mentioned to Scott that I'm gonna snoop around the limits of the old Novice band on 40-meters, to see if that might be a more "hospitable" place for us (7100- to 7150-KHz). It can't be any worse than the current situation, right...?

Hi Eddy,

For starters, I haven't been privileged with hearing your usually big signal on Topband yet this year...!

I've been too distracted to concentrate on important things like radio! A series of questionable decisions and unforeseen circumstances have led to this place not being anywhere near winter ready. Howling wind and quickly deepening snow today serves as a further reminder time is growing short. I have been on long enough to give good chase to 3D2R (missed), H40KJ (missed) and TL0CW (worked) but that is about it so far. One for three... hmm, maybe my "usually big signal" isn't so big, hi!

AWA actually had a separate 160-meter QSO Party

Seems like a good idea to me.

Maybe that would be a viable option to prevent the 1929 QSO participants from "...spreading themselves too thin" all over the low-band spectrum (our numbers are not that large to begin with!).

Yes, that seems a reasonable concern. I'm just approaching my first participation in the BK event and already wondering if I will make sound decisions about what band to be on at what time. The more bands the tougher those choices and the greater the possibility of missing some QSOs. My decisions for this year's event may now be very simple with last night's loss of the 80 meter antenna! (just checked and see that 8 of 8 Beverage directions are dead also)

I also mentioned to Scott that I'm gonna snoop around the limits of the old Novice band on 40-meters, to see if that might be a more "hospitable" place for us (7100- to 7150-KHz).

I've been doing a little of that, though as noted my radio time has been very limited. There seems to be a good bit of general CW activity and relatively low BC QRM just above 7100. I recently had a good QSO with K4JYS somewhere around 7112 if memory serves.

Now the third attempt to push my post thru....

I apologize if this comes thru twice...first post hasn't come thru yet, maybe this one will.....

GM Paul and Eddy,

Since our winters are not too bad (usually) here in NC, I have the luxury of doing some antenna work at most anytime of the year. Not being as enthusiastic as when I was younger, I don't climb the tower much thus the big beam, needing work, ain't getting it. So I have resorted to a number of wire antennas, which suit me now that I don't actively chase DX any more. But as the saying goes, real hams do their antenna work in the worst of wx condx. Good luck Paul! I have a cobbled up inv. L on 160 so maybe I will run across you guys this season. I generally run a Viking 2/HQ-170 combo on top band.

As far as adding 160 to the BK...I'm not much in favor of that. I think the comment about 'spreading too thin' is very true. There are probably only 30-40 total participants. I also wonder how much total activity there would be on 160. I feel like it would be more fun to return to a dedicated 160m QSO party...maybe, one in which most any age tx could be used for points, but more QSO value for the '29/30s type rigs (the wider age spread would, possibly, mean more participants). I would be in favor of most any operating event to get our '29/30s rigs on the air more. Also, another advantage of a 160m event, would be that a lot of us would need to build up a new tx for 160m use. I know on my TNT/Hartley there isn't enuff room to add a 160m tank coil so a new rig would be needed....hooray. And another thing to remember: don't stir up the dx'ers...so we would only have about 15kc to play in, which would probably be enuff.

And Paul: Don't get to concentrated on a 'contest strategy'. Just go with the flow. You will have more fun that way. You will gain some experience each year as to what 'strategy' to use. I generally start out on 80 and when things slow down, ck 40 for activity. Remember, this is a laid back event...and you are a winner...period, even with just a few QSOs in the log. ANY contact I make with my '29 rigs is a hoot...at 339 or 599, I don't care. The BK event is a thrill and I have never been disappointed..regardless of how many QSOs I make.

Our present 'hangout' spot on 40m is trashy at best. Altho, I have made some good contacts there, the QRM from digital/ssb and just plain lids is rough. Maybe a change to above 7.1 would be a good idea. I have run into some dx ssb QRM in that section, but generally there is not too much digital garbage (except occasionally at 7.1 & up a few kc.). I would not like to see us push both spots...my vote would be for one or the other (the 'spreading thin' issue agn). As Paul mentioned, we did have a good QSO above 7.1 and I operate up there quite a bit.

Boy, this list has had some great threads lately...a great bunch of members...tnx to all,
73, Bill K4JYS

Hi Steve--

Your question is best referred to Tim. I merely provide space for what he wants to communicate. I'm copying him on this so you will have his address.

We have had some trouble in the past with lack of space (remember we are only a quarterly magazine and have a limited page count)--especially when the results for two or more events need to be discusssed in the same issue and the coordinators have a lot of comments they would like to publish alongside the results.

I know that Tim is trying to work with the spacing of result reporting for the various events to keep things from piling up in one issue.

Marc

Marc - In recent e-mail to the group, Scott has indicated that there will no

longer be any detailed contest description pages nor will there be the usual

'after contest summary / soapbox pages', merely a list of scores.:

" Tim and Marc informed me recently that the Journal will no longer announce

the BK 1929 with the one or two page write up that John Rollins and then I

have been doing for many years. The purpose of that write up was to not

only inform you guys of the event, the rules, the dates, etc, but also to

create interest from new members and existing members. I was told that

only dates will be announced now in the Journal and you have to go to the

AWA website to find out the details. I was told that the results will be

published in the Journal but none of the text or discussion article. "

Can you confirm (or not) if this is truly the case and that these contest

activity discussion pages will no longer be part of the Journal?

Thanks,

Steve

I am very much in favor of moving our 40m BK activity above 7100kc. as the digital activity taking place in our previous window continues to increase. As well, there seems to be a digital contest almost every other weekend now .... I fear that we may be fighting a losing battle by staying put.

I think what we need to do is establish a definite new 40m watering-hole, around which our activity should be centered and I'll go out on a limb and suggest that it be 7110 + / - ....comments appreciated.

For those that will not be aware of this move, I would suggest that we occasionaly keep an ear out on the old window and inform any '29ers operating there that most of the operations will be happening near 7110kc. Perhaps if you know of any 29ers that might not be internet capable, you might contact them and let them know. I know there a bunch in Minnesota that don't seem to be active here...maybe Niel could somehow reach a few of them.

Also, it is not too late for the AWA webmaster to easily insert an *alert regarding the BK contest 40m plan. I'm not sure who that would be.

Eddy is bang-on with his 160m window...right at the low end, just like the good old days, where we asssuredly will not be a bother to anyone. Maybe 1810 for the watering hole +/-. Most of the serious CW work is now being done above 1820. Note that for this year's BK, a few brave souls will be on topband for a few hours on the second weekend. We might want to decide on a 'topband hour' so we are all on the same page, closer to QSO Party time.

As for strategy Paul, I have found that out here on the west coast, 80m is the busiest band for activity although transcon QSO's are much easier on 40m. I spend the first hour (daylight here) on 40m trying to catch some of the midwestern and lingering east coasters before they make the big move to 80 for the night. Some of the best 80m transcon QSO's occur around the east coast sunrise and after that occurs, I move back to 40m for a few more. Unfortunately there seems to be no daytime activity here at all. Maybe it's time for 20m too...forget I said that ;-)

Thank you Tim...it sounds like you are saying that there has been no official policy to remove this coverage from the Journal. As others have stated, I would see any downsizing of contest summary / soapbox / photos as a terrible error in judgement and in the end would surely result in a large decline altogether in these AWA sponsored amateur radio events. Hopefully Tim can shed further light on this critical topic.

Steve is correct on the dx activity. However, maybe not too much down below 1.820 in the early evenings. But a few polite QRLs? before we operate near the 1.820 area (and on any freq) should keep us out of trouble. Also, W1AW has BC at various times in the early weekday evenings on 1.8025kc. They are extremely strong here in NC...we won't bother him, but he may wipe us out if close to his freq.

Steve is correct on the dx activity. However, maybe not too much down below 1.820 in the early evenings.

On this point I will chime in. Very often some quite exotic DX by 160 meter standards (such as southeast Asia) is looking for North America in the 1810 to 1820 area at and shortly after east coast sunset. They are there a lot more often than people may realize. The lack of North Americans calling is an indication everyone is listening, waiting and hoping for a strong enough signal from the DX to permit a QSO. When it does happen, the usual "window of opportunity" lasts but a few moments, making this activity particularly vulnerable to QRM.

There is very rarely any real DX below 1810 because in much of the world the amateur allocation starts at 1810.

Personally I don't believe I would ever be comfortable calling CQ with an antique sounding signal above 1810. Others might. To each his own. I might venture there for a short QSO in response to someone else's CQ.

For what it's worth W1AW moved to 1802.5 not too long ago due to ongoing pressure to vacate the 'DX segment' of the band. They were previously on 1817.5 or thereabout.

Subject: RE: [AWA Group] Re: Journal and 160m and 40m

Eddy is bang-on with his 160m window...right at the low end, just like the good old days, where we asssuredly will not be a bother to anyone. Maybe 1810 for the watering hole +/-. Most of the serious CW work is now being done above 1820.

There is almost daily DX activity (propagation allowing) below 1820, but rarely below 1810. I've been part of the early-morning legion of topbanders trying to dig XU7 out of the noise this past week or two around 1812 - 1817. There is enough activity 1810 – 1820 that it may be a bother to those listening for DX. I might suggest 1805 +/- and a "window" 1800-1810.??

I’m finding this whole idea pretty exciting. Nice to have this season to get the rigs set up to operate 160 and make a few QSOs.

OK...I didn't realize they were that low now....I guess their signal would
definitely keep us in 'quiet-mode' until they finished.

Good deal if you can find it, for sure.

From my experience it's not too difficult to find good used '01As at radio meets for $10 ea. On line prices tend to be higher.

GM Paul and Eddy,

Since our winters are not too bad (usually) here in NC, I have the luxury of doing some antenna work at most anytime of the year. Not being as enthusiastic as when I was younger, I don't climb the tower much thus the big beam, needing work, ain't getting it. So I have resorted to a number of wire antennas, which suit me now that I don't actively chase DX any more. But as the saying goes, real hams do their antenna work in the worst of wx condx. Good luck Paul! I have a cobbled up inv. L on 160 so maybe I will run across you guys this season. I generally run a Viking 2/HQ-170 combo on top band.

As far as adding 160 to the BK...I'm not much in favor of that. I think the comment about 'spreading too thin' is very true. There are probably only 30-40 total participants. I also wonder how much total activity there would be on 160. I feel like it would be more fun to return to a dedicated 160m QSO party...maybe, one in which most any age tx could be used for points, but more QSO value for the '29/30s type rigs (the wider age spread would, possibly, mean more participants). I would be in favor of most any operating event to get our '29/30s rigs on the air more. Also, another advantage of a 160m event, would be that a lot of us would need to build up a new tx for 160m use. I know on my TNT/Hartley there isn't enuff room to add a 160m tank coil so a new rig would be needed....hooray. And another thing to remember: don't sti r up the dx'ers...so we would only have about 15kc to play in, which would probably be enuff.

And Paul: Don't get to concentrated on a 'contest strategy'. Just go with the flow. You will have more fun that way. You will gain some experience each year as to what 'strategy' to use. I generally start out on 80 and when things slow down, ck 40 for activity. Remember, this is a laid back event...and you are a winner...period, even with just a few QSOs in the log. ANY contact I make with my '29 rigs is a hoot...at 339 or 599, I don't care. The BK event is a thrill and I have never been disappointed..regardless of how many QSOs I make.

Our present 'hangout' spot on 40m is trashy at best. Altho, I have made some good contacts there, the QRM from digital/ssb and just plain lids is rough. Maybe a change to above 7.1 would be a good idea. I have run into some dx ssb QRM in that section, but generally there is not too much digital garbage (except occasionally at 7.1 & up a few kc.). I would not like to see us push both spots...my vote would be for one or the other (the 'spreading thin' issue agn). As Paul mentioned, we did have a good QSO above 7.1 and I operate up there quite a bit.

Boy, this list has had some great threads lately...a great bunch of members...tnx to all,
73, Bill K4JYS

Hi Eddy,

For starters, I haven't been privileged with hearing your usually big signal on Topband yet this year...!

I've been too distracted to concentrate on important things like radio! A series of questionable decisions and unforeseen circumstances have led to this place not being anywhere near winter ready. Howling wind and quickly deepening snow today serves as a further reminder time is growing short. I have been on long enough to give good chase to 3D2R (missed), H40KJ (missed) and TL0CW (worked) but that is about it so far. One for three... hmm, maybe my "usually big signal" isn't so big , hi!

AWA actually had a separate 160-meter QSO Party

Seems like a good idea to me.

Maybe that would be a viable option to prevent the 1929 QSO participants from "...spreading themselves too thin" all over the low-band spectrum (our numbers are not that large to begin with!).

Yes, that seems a reasonable concern. I'm just approaching my first participation in the BK event and already wondering if I will make sound decisions about what band to be on at what time. The more bands the tougher those choices and the greater the possibility of missing some QSOs. My decisions for this year's event may now be very simple with last night's loss of the 80 meter antenna! (just checked and see that 8 of 8 Beverage directions are dead also)

I also mentioned to Scott that I'm gonna snoop around the limits of the old Novice band on 40-meters, to see if that might be a more "hospitable" place for us (7100- to 7150-KHz).

I've been doing a little of that, though as noted my radio time has been very limited. There seems to be a good bit of general CW activity and relatively low BC QRM just above 7100. I recently had a good QSO with K4JYS somewhere around 7112 if memory serves.

Don,

You'll find by far the bulk of the 40M AM activity on 7290 and 7295, occasionally 7160 and 7285. I just talked to WA1OBD on 7295 a little over an hour ago.

This weekend I wound the 40M grid coil for the TNT, and installed a retrofit for a vernier drive (see attached photo for detail of the drive).

There is still some hand capacity effect, but the rig is MUCH easier to put on frequency than it was with just the solid knob. And since it's now on 40M and not 80M, it should be even better up there.

Just had my 1st 40M QSO with it - KE2EE, Mike in Albany NY, around 7105. We chatted for about 50 minutes. ~3W out for 10W in, slightly poorer efficiency than on 80M

I agree that we should focus our BK 40M activity just above 7100.

My Hartley TX is hand sensitive too but the ones in my RX TX are not. Not at all. You actually have to squeeze the coil to get an effect. Difference I see is they are grid cathode ground hartleys instead of Grid Cathode Plate Hartleys. I am tempted to build another CW one with that circuit style (Grid Cathode Ground) and put a Tank Circuit in the plate crcuit and see what happens. Probably wont have the power our regular design ones have. Then in a moment of inspiration I realized I can just wire a key and screen bias into this RX TX and key the carrier for CW with the CW circuit bypassing and overriding (or substituting) the screen modulation circuit. Then I will have a VFO controlled 40 Meter Hartley already done 'cept for one tiny problem. 1930s tubes. Whoops!

4077. Bruce Kelly 1929 QSO Party Write up

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-31 18:36:03 UTC
From: whitebear1122@comcast.net
Topic: 3957 Message: 4077

Here is the write up that I'm submitting to Tim Walker W1GIG this evening. I have taken the advice of the group and moved the 40m frequency up to 7110 in order to avoid all the digital modes , cw contesters, cw nets, and high power cw. I'll occasionally li sten down at 7040 in case a 29'er is still operating down there but plan to spend 99.9% of my time at 7110

The 2011 Bruce Kelley 1929 QSO Party

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cancatny of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, worbling, and other interesting signals. This is what ham radio sounded like in 1929. The 1929 QSO Party was started and championed for many years by Bruce Kelly W2ICE, an AWA founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Several years back John Rollins asked me to manage the 29 QSO Party for him and Bruce. Bruce Kelly and John Rollins are now Silent Keys but I know both John and Bruce will be with us in spirit.

Dates and Times: First two weekends of December, Saturday Dec 3 through Sunday Dec 4, and Saturday Dec 10 through Sunday Dec 11. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT , PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Individual stations can be worked only once on 80 meters and once on 40 meters over the course of two weekends. If you are contacted by a modern station who is seeking information about the QSO Party, that contact may be counted. For those occasional modern contacts, use the word MOD for his transmitter. You can use any vintage or modern receiver that you wish.

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and my plate current is 30 ma, so my total input power is 300 x 0.030 = 9 watts input.

Frequencies: NOTE THE NEW 40M FREQUENCY. The QSO Party operates in both the 80 meter and 40 meter cw bands. The QSO Party typically operates between 3550 to 3580 Kcs and 7105

to 7115 Kcs, plus or minus depending on QRM. Note that the 40 meter frequency has moved up into the old Novice band to avoid the digital modes, contesters, cw nets, and high power cw.

Logs: Either electronically email your 1929 log to Scott at wa9wfa@... or mail via post office to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, Saint Paul, MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. Please do not email logs to any other email address except the one above. Last year some people emailed logs to my work account, to my family email account, to a secondary BA list account, besides my wa9wfa email.

Scoring: Scoring is simple. Add up the number of 1929 QSO’s on 40 meters and 80 meters. Example: if you make 15 QSO’s on 80 meters, and 10 QSO’s on 40 meters, your final score is 25. All submitted logs will be scored and the results published in the AWA Journal. Please submit logs by January 15, 2012.

Good luck to all participants and please send me a photo of your 1929 station. Thanks.
73, Scott WA9WFA

VY FB, Don!

Wanna try for a sked on 7290 KHz at 8:00Am EST tomorrow Tuesday morning?
I'll call you, as I'll be running ~300W.

73,
-Larry/NE1S

Thanks Larry.
I monitored the test on a recvr some distance away. Here it is first voice.
http://www.youtube.com/watch?v=5QPL-xgAOPk
I may have the modulation control a bit high but I am surprised how it sounded. Thrilled would be a better term. Of course the carbon mike sounds like , well a carbon mike of course but I am ok with that for this rig. When Did Am become used in ham radio on a sort of regular basis? Thanks for the hints on where to go. I asked on an AM site for a freq recommendation but just got comments about D---n Canadians.
Man the world has changed.
I am still waiting for a couple of power resistors for its extra PA but decided to try it barefoot for now.
A lot is my own circuit version borrowed from a few others . Especially the VFO portion which is BTW a Hartley.
Thanks Again for the hints
Don VE3LYX

OK I am tuned up and will be there. I doubt my fleapower will reach you but I am game to try.
BTW My power resistors came today and one is now installed in my PA I am doing. I have a Rf choke curing downstairs. (AKA glue is drying) 200 turns 22 on a 1/4 dowel. I have a bit more wiring to do on it but not huge. It is not very big so I am calling "mighty mouse." Of course it has a 50l6 . I run the rig barefoot in the morning though. I dont want to rush the PA build.
Thanks Mike for your comments as well.
Here is mighty mouse awaiting a couple more parts. It is no Henry but it will have to do!

OHH! Very cool!
In one of my 1927 Radio news there is an article on giving a violin it voice. They made a Carbon mike deal to clamp in the F hole and rewound or I should say added 2 LBS of #22 wire to the seconadry of a Telephone Audio transformer. They gave two amplifier circuits . Simple and complicated, and showed how to modulate it. In the next issue they built a 36"speaker to use with it. I have some carbon battery rods. I might be able to make one. I have however bought two carbon miltary style miles and a real nice set of earphopne and carbon mike deally from a little antique store in Perth Ontario. Last time I was there he even had a working wire recorder for sale.

4086. 29 QSO Party Band Strategy

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-10-31 22:01:05 UTC
From: whitebear1122@comcast.net
Topic: 3957 Message: 4086

Someone on here asked the other week whats the best band strategy between 40 and 80m. I can only tell you what I do and what I seem to hear others doing. Most seem to start out on 80m at the beginning of the event on Saturday evening, continue to work 80m late into the night. I hear plenty of 80m 1929 stations early on the morning but by 10 AM 80 has petered out and it seems the group shifts to 40m for the rest of the day. For me 40 is a nightmare with all the digital noise, RTTY contests, cw contests, SSB, high power cw, etc and then try to pull a peanut whistle signal out of all that. hi hi In the midwest, 80m starts opening up again maybe around 4 PM so I shift back to 80m for the last hour or so. Last year 80m didn't open up till 4:30 pm, leaving me only 1/2 hr. 73, Scott WA9WFA

> My Hartley TX is hand sensitive too but the ones in my RX TX are not. Not
> at all. You actually have to squeeze the coil to get an effect.
> Difference I see is they are grid cathode ground hartleys instead of Grid
> Cathode Plate Hartleys.

They are electrically equivalent - the one you call "grid cathode ground" is equivalent to "grad cathode plate" because the plate is grounded for RF (bypassed to ground).

The critical difference for hand capacity effects is for that configuration the rotor and frame of the tuning condenser are grounded, while in the other they have RF on 'em.

> already done 'cept for one tiny problem. 1930s tubes. Whoops!

No problem! Use an 865 for the PA and a 24 for the detector, and type 27 triodes to substitute for the 6SL7 triodes - but you'll probably need more of 'em (more stages) because the gain/stage will be much lower. And you'll need new heater and plate supplies. On 2nd thought, it sounds like a complete redesign/rebuild ;-)

R390 ?! My Dad would be proud of you. He is aa former Collins Radio (of Canada) radio design engineer . His specialty was Aircraft Radio. Closest I ever got was I have a Collins mech filter installed in my TS830S Kenwood. My brother who dealt in surplus gave it to me and I asked Dad if it would work. He said yes. It does. Almost too well ;>). Asked him if screen modulation would work about a year ago. He gave me a one word reply. "Certainly" Now everytime I see him he asks if I have it up and running yet. I just sent my niece the Youtube link of its first test a hour ago. She will make sure he gets to see it. He s 87 but you can ask him a radio question and it just pours out. He might forget who I am but he still knows most tube data by heart . He never wanted to be a Ham. I dont understand why. Never will.

Don VE3LYX,

I called you on 7290 KHz AM several times between 8:00AM and 8:15AM local time; needless to say we didn't hook up. Probably later in the day would be better; say, around 11:00AM, because there was still a European broadcast station on the frequency that could be heard here. Unfortunately I can't do that today, because I need to drive my mother to Yarmouth for a blood test around then.

I did here something that could have been an unstable signal swoosh through my passband a few times, and it sounded like there was some 60 cycle AM or FM modulation there, wonder if it could have been you? I didn't hear any voice modulation on it, though.

I wonder if you heard me calling you?

> Maybe others here know the whys of this.

What is very odd in Bill's case is that some of his posts don't get flagged as possible spam, while many do. THAT I cannot explain. If all of his posts were being flagged as spam, I would suspect someone else using his mail service (embarqmail) had been sending spam and the mail server had been placed on one or more of the known spammer lists. Perhaps embarqmail doesn't always process or route outgoing mail the same way?

If Bill's posts were late showing up at Yahoo, I would suspect intermittent handling delays on the part of embarqmail or something else in the routing to Yahoo. But Lou has indicated they are getting to Yahoo but being flagged as possible spam. It is odd.

Bill, do you have another email account you could use for the group? That might solve the problem.

I won't go into all the boring details of issues I have had with my mail provider's server being placed on known spam server lists!

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-01 14:17:48 UTC
From: Bill Stewart
Topic: 4094 Message: 4106

Guess my luck ran out....the org. of this was sent at 10:00AM EDT

11-1-11. I'm sending w/o Pauls orig. msg

Tnx Paul for some explanation. I don't have another email acct..its all thru embarq. So far the msgs are coming thru pretty quickly this morning . I have seen some posted msgs, either on this list or others, that are labeled SPAM in the heading...are my msgs labeled that way? Is there a list available that might say if embarq is a spam generator? Are there any other embarq users on this list and are their msgs also labeled as spam?

Bill

Subject: [AWA Group] BTW - spam / moderation

I think I figured out why several of my recent posts required moderator action. Yahoo doesn't like me including links to my web site. Every post with such a link was delayed. Every one without was not. Now that I know that, I won't do it any more guys. Sorry for the extra work.

Bill,

There are several "known spam source" lists you could check for embarq. Unfortunately I don't have the URLs for them handy at the moment.

Another thought. Your posts appear to be composed in HTML. According my my mail client, you are using something called Zimbra Web Client to write your posts? Never heard of it but it seems to be including quite a bit of html/css code (not visible to the average reader, but buried in the message source). It's conceivable Yahoo sees something it considers a red flag in there somewhere. If you're using a web client / browser (it says IE8) to compose mail, I'm not sure if you can compose in plain text. If you can, it might be worth trying. Just a thought.

Bill,

I've found that posting/responding via email will lots of times slow things down.

Log into the AWAGroup on yahoo at http://groups.yahoo.com/group/AWAGroup/messages and reply via that web interface. Your message should show up right away.

Well done Scott and many thanks for 'making it offiicial'! Hopefully with the new clearer 40m watering hole, there can be more transcon work than ever. As I have done for the past two Parties, I'll suggest again, that all stations that can get on 40m, stay there for the first two hours of the activity so that we might have an opportunity to work before going to 80 for the duration. The other best time for west coast on 40m is just after your sunrise on Sunday morning, as it will still be dark here for another 3 hours.

Steve

That's very odd Paul as every one of my posts has a link notification to my own site at the very bottom. Like Bill, I saw one of my messages also sent on Oct 20th show up today too but it was on a different list, but also a Yahoo Group list...maybe Oct 20th was a glitchy day for them. Other than that I can't ever recall having a delayed posting. Most mail flagged as spam will have a key word somewhere either in the subject field or within the message text that their spam detector doesn't like and often rewording the subject or having a look at your message info will turn up the offending phrase or word. I think also that most delays, that are not spam-trapped, likely originate from the senders outgoing isp server.

Lou,

I've gotten my BK station set up (Ross Hull Hartley and a 1940 Simple Superhet) and have had a few QSOs (Illinos and Michigan) but mostly failing at putting up an improved 80mtr antenna. It will be interesting to see how well I get out of the upper mid-west come December.

I've checked my receiver on 7105-7105 and it should be fine for the BK. In the next few days I'll put the 40 mtr coil in the Hartley and try that out.

73,
Niel

Steve, my theory is it takes exception to the particular links I posted. I no longer use my web host's SMTP server for outgoing mail, as too often they manage to get that server blacklisted. They terminate the offending client's account and get it un-blacklisted pretty quickly, but it happens often enough to be annoying. Maybe their web servers attract unwanted attention too. As you say though, it could be coincidence. I don't remember the date(s) it happened now. I'd try an experiment to see, but Lou might send another bill if one gets spam-trapped. :o))

4117. Re: [AWA Group] 29 QSO Party Band Strategy

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-01 19:16:48 UTC
From: N1BUG
Topic: 3957 Message: 4117

Scott, Thanks for the write-up and comments on band strategy. I doubt I will submit a log, but do want to make as many QSOs as I can.

Today it dawned on me how little time is left to prepare. The new power supply certainly won't be ready so will I have to limp along with what I've been using. I wish I had more time to devote to preparations, but if I don't get my house back together soon it's going to be a mighty drafty winter!

I did get the 80 meter antenna functional again, although at a lower height. I took the quick approach and sawed broken antennas and masts into manageable sections, then threw them off the tower. The big pieces make a nice thump after falling 80 feet. :-) The assortment of steel and aluminum sticking out of the ground around the tower reminds me of some modern art I've seen.

Hi Paul,

I hope your 160-meter antenna(s) there survived everything A-OK...

Been rather busy here with renos myself---and dealing with the aftermaths (financial, and otherwise!) of ill-qualified, lazy---but expensive!---folks who have the nerve here to call themselves "...tradesmen". I'll be so glad when winter finally descends upon us all, & we can get back to just making QSOs & reading old QSTs beside the fire, snifter of brandy in hand!

I re-habbed my east K9AY loop the other day (had an open jumper cable for the east loop), and to-day I laid-down my radial field for the south "L". Just for giggles---until such time as I can get the east "L" going again, too---I've connected the north & south "L" together, & am phasing them 180-degrees. The theoretical gain with my 1/4-wave spacing is 3.5 db---good for Japan & South America, I guess. We'll see in the next day, or two...

Had a listen to the 160-meter AWA SSB net the other day---signals sounded very good here! I was sorely tempted to jump in, but I didn't want to re-set the transmatch controls to do so...besides, I never had too much time (I gathered that the assembled net participants were large in number).

Hope to hear you again soon on Top Band...

Topic: 3957 Message: 4122

Paul, I encourage you and everyone else to submit a log no matter how many or few contacts are made. If not for your own enjoyment, send it for our enjoyment. We like to see who all is in the event whether we worked them or not, what tx configuration and power they were running, and how many contacts were made with that setup .

I recall the other year getting a log from a proud 1929'er with his 1 contact. The contact meant so much to him that he made the effort to send a log in via mail.

From what I'm told, only the scores will be published in the Journal, not the write up or analysis. I used to go through every log and record every callsign worked so publish a list of ALL 1929 stations participating regardless if they sent in a log or not. The published scores only represent those stations that sent in a log. There are often 20 stations that don't send in logs but I still want to know about them.

Now with all that said, I don't want to be a hippocrite so I apologize to WU2D for not sending in my Linc Cundall log from last year. I will make a better attempt this year at sending in the log.

Yes time does pass quickly and suddenly it'll be time for the 29 QSO Party whether we are ready or not. My shack is still being remodeled. The drywalling should be done tomorrow, and if we're lucky, the carpet will be going in late next week. There will still be all the trim work to do but I can set up an operating position for the 29 station and work the bugs out if it.

Topic: 3723 Message: 4125

Ok 930 am EDT. 7290. It is 351 as I send this. 1330 Zulu.
I got the PA done and was tsting it. Draws too much current. Current limit resistor was smoking. I wsnt sure why . Wondered if I have the no1 control grid not biased well. Everything seems ok otherwise so i tested it with an extra limit resistor in paralel with the original . Current would be higher but it would handle more watts. Ut was ok and i ran it for a while no trouble. I put it on the Dummy load and drove it with the RXTX. Seemed good. I listened in my monitor rx and even thugh in the dummy load Volume jumped when the Amp was on and faded quickly to normal when i cut the power as the tube cooled. Seeemed ok. SO I decided to try it on the antenna. After the fire..... Well it did bump the meters in the shack and did so sound good but then the current limit resistor group developed some smoke. I killed the exciter and went to grab the line switch for the PA.In my excitement I knocked it on the floor. The smoke was now an orange flame and before I got it off the glass in the tube Cracked with a loud pop. So obviously I have some things to learn about beam power RF amps. I checked though and the RX Tx survived unscathed and is working fine.
I know ths alll sounds silly to those who inderstand this stuff. Me I am learning. I have to figure this out. I have 50L6s in the shack in CW rigs and this RX tx.(has 2) I wonder what i did differnet that caused this one to draw so much current even without being driven. Gotta think about it. Twas a bit exciting at the time though.

4127. Antenna/Band Checking

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-01 20:52:25 UTC
From: Niel - W0VLZ
Topic: 4094 Message: 4127

Last year I made good use of the Reverse Beacon Network at http://www.reversebeacon.net/index.php . It allows you to do A vs B antenna testing and/or check to see if the band is open. It is backed up by a network of automated receivers around the globe. For any CQs heard it posts the call heard, who heard it, frequency and signal strength.

Once at the site go to the "main page" and then "search spot by call sign". Fill in your call as "DX". Call CQ a few times and then click on search. Any reverse beacons hearing you will post your call, the frequency and signal strength. Shift frequency slightly, change antennas and try it again.

See http://w0vlz.blogspot.com/2010/12/80-mtr-vertical-performance.html for an example of how I used this last year to compare my two 80 meter antennas.

Just a hint for those of us using '29 rigs ... Ross Hull may have thought a T8 musical signal was fine but not this network. I have to use my main station transceiver at 100 watts to get a lot of data points.

73,
Niel - W0VLZ

I hope your 160-meter antenna(s) there survived everything A-OK...

Hi Eddy,

160 meter transmit antennas are fine. All the Beverages were down (darn trees!) but I have them up and running again.

ill-qualified, lazy---but expensive!---folks who have the nerve here to call themselves "...tradesmen"

I know what you mean! I had my fill of those long ago. Now I do everything myself. I'm a jack of all trades, master of none... but I'm a lot less expensive and at least I care about the quality of my work.

It sounds like you're getting close to having everything back to full speed on topband there. It will be another two weeks or so for me. I've got to get enough of this ill-fated project done so I can install a door at least! I prefer to keep snow on the outside... one of my silly quirks! :)

Hopefully, things will slow down before the BK so I can enjoy it! I'm going to have to rip apart my DX setup for that so I can move the main station transceiver close enough to the vintage operating table to use it in the event. That's easier than trying to find a stable place for the TNT near where the main rig usually sits!

73,
Paul N1BUG

Bill, I wouldn't worry about it. As Niel said, probably the surest bet if you can stand doing it that way is to do all your group posts from the Yahoo page.

But, in an effort to answer your question... there is no "correct" or incorrect way to do it. Basically there are two ways to compose email. One is plain text. The body of the mail contains ONLY the characters you type on the keyboard, but you can't change fonts, add color, bold, italics or anything like that. Then there is HTML which USUALLY allows you the luxury of such things, but at a price. It also adds a lot of invisible gobbledygook to the body of the message. Said gobbledygook contains instructions for computers on how the text should be displayed (fonts, colors, etc.) but is not in itself visible to the recipient. However some mail servers processing messages have been known to take offense at the hidden message format coding. It's rare but it happens. The program you've been using to write posts has been adding quite a bit of that hidden formatting gobbledygook that you knew nothing about... and in a form not usually seen. I have the option of looking at the "raw" body of emails... text AND gobbledygook... which is how I saw what your software is sneaking in there behind your back. :-)

I'm answering my own question for sake of the group archives (might be of interest to others someday?)

According to a trusted source the socket is a Kellertone. Oddly however I can find no references to such a company.

Happy ending... I did find two more to buy :-)

Paul

Larry,
I just came in to set it up for tomorow. It's hurt. Oscillates at audio level and recvr is unusable too. maybe I pushed the old girl too hard.I will have to take it apart and see what popped. I must have not checked it but i thought I had. Probably confused in the excitment. I dont know why the recver is goofy. I switch B plus from one section to the other when going from RX to Tx so the tubes arent working except the heaters. I swapped tubes from the tx to the rx and see. but something else is wrong too in the tank. I suspect there are some popped caps or something. So hang on for a couple of days.at least till I figured it out. I also have to figure out a protection for my PA. so it doesnt run away when undriven.

OK! As my previous post said, I can't make it today anyway. Let me know when you are ready.

A simple way of protecting the PA is to use a combination of grid-leak and cathode bias. Use a resistor or Zener diode in the cathode circuit to bias the tube for class A conditions (see tube manual), and then make up the rest of the class C bias with grid-leak bias. This way, the tube is class A biased on key up and is therefore safe, and is biased for class C when transmitting. Make sure the cathode is well-bypassed to ground for RF AND audio. (I'd use 3 caps in parallel: a 0.001 uF disc ceramic, 0.1 mylar, and a 10uF or higher electrolytic). This is a lot simpler than clamp tube schemes.

4137. More TNT news

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-02 11:28:42 UTC
From: ne1s@securespeed.us
Topic: 4137 Message: 4137

A few days ago I posted that I had the TNT with PP 71As working on 40M.

My first attempt at a 40M grid coil didn't have enough turns. Since I had one more form, I set that coil aside and wound my second attempt at a 40M coil, this time successful, on another form. I thought I would remove turns from the failed 40M grid coil attempt to make a 20M coil.

Yesterday, I started to do that. But, before I removed enough turns to reach 20M, I got a resonance on the 30M amateur band, and the 20M plate tank coil (4 turns of tubing) resonated FB on 30M with the condenser nearly fully-meshed.

Since the signal quality on 30M is already pushing the envelope (OK, even the 40M signal is pushing the envelope!) I'm thinking about stopping here and not going to 20m with the TNT. I'm out of suitable coil forms, so it has to be one or the other. (I know 30M wasn't an amateur band in 1929!)

Opinions? 20M or 30M?

Yes it says PAT. PENDING on the top. That is the only marking except for the F, F, G, P marking the posts and the little white arrow. It is a very sturdy socket and gets an unusually tight grip on tube pins.

I would stop at 30m, but then I am partial to that band. I spend a lot of time there using PSK. The 200w limit, no contesting, and no phone mode, makes for a quiet band.

Ok so I make a cathode reistor circuit figured out from total ma into volts , install that in the cathode to ground leg and bypass it to ground with your style cap pack. Then when it isnt beng driven it cant run away. ? I think I have it. I also made a huge mistake. I had far too much screen voltage. I had about 90% of plate voltage (mid 200s under load) but according to specs at 200 plate volts even screen is still recomended at 135. If that is so I can steal that mid point in my PS system.(mid point in my voltage doubler is 154 and I can drop it from that with current sreen resistor.) So even with the cathode resistor I bias the control grid similar to what I have now to get Class C operation?
Thanks for the help. Glad someone is there to help with your antennas. As we age that becomes a major difficulty. All the best.

My TNT is 20/ 40. Same grid coil with a clip either far end or centre tap. It is just a flea power deal (01A) but the tank tuned both easily so I did it. Of course you could have all three. A TNT tribander the same way.

GM Niel,

I've gotten my BK station set up (Ross Hull Hartley and a 1940 Simple Superhet) and have had a few QSOs (Illinos and Michigan) but mostly failing at putting up an improved 80mtr antenna. Time for that certainly.

It will be interesting to see how well I get out of the upper mid-west come December. Don't forget S.W. Ontario!

I've checked my receiver on 7105-7105 and it should be fine for the BK. In the next few days I'll put the 40 mtr coil in the Hartley and try that out. CU you on 40...

I am back in business (no extra PA but that will take time) One of the 12sl7s went south. i swapped it to the rx and the rx one works fine in the TX. I spent time tryng to get the hum factor down some too. it is more annoying on the Rx since it is a regen. Not sure I made much progress but I tried . It was the modulator /osc tube that is acting up. I am good now. . Tested and tuned up on 7290. The bum tube actualy works or seems to in the rx still. I will wait till propagation picks up and test it on RX too. Otherwise I need to buy another. (I will anyway)

Hi Paul,

I heartily agree with Scott's sentiments!

Besides letting other participants see how you've done in the event, it really & truly IS kinda nice to see one's call sign on a printed page like one of those within THE AWA JOURNAL---especially after that blood, sweat, & tears that you expended in your concerted effort to make QSOs in the event!

Besides, by leaving your "mark" like this, you've left behind but one more proverbial footprint in the sands of time...your score submissions will say, " I WAS HERE!" to (hopefully!) those legions of Hams in the future who might follow in our wake...

Good evening all,

A while back, while taking a periodic thumbing thru the old QSTs, I ran across a couple of articles in the May & July 1924 QST on the 3 & 4 coil Meissner. It looked sorta interesting so I gathered a few parts and a '01A tube and thru together the 4 coil version. Well, the last few days I found out that it will oscillate. The first indications were up around 20mc but I fiddled with the variables and coils and got it down to 80mtrs. It is now growling on 3575 kc. The note is rather ruff, but there is a slight musical note amongst the growling. I've got about 100-125 volts on the plate of the CX-301A and drawing around 20-30ma. Not enuff output to light the series antenna lamp and even the f/s mtr is not indicating very high. Any higher B+ and it starts chirping. With 100-125vdc tho, its pretty stable. I'll keep dinking with it and see what develops...maybe not a project, but just something to try. I may be asking some questions later as I progress.

Speaking of Hartleys I like to operate at night in the dark . I like the glow of the tubes. The purple ase lectrons bounce off the glass but I could never see to copy code. Now I can. I installed an ancient dial light from an old radio (the one with the #56 tubes) I bought a proper voltage bulb from The Source. (Radio Shack) and installed it. Light is in the filiment supply circuit before the reo so regardlessof what tube I a using (2.5 volt , 5 volt . 6.3 volt) light is still good.. It is just enuf to copy code and read nicely without running the setting. The key suit too . The pen isnt period correct but I couldnt catch the goose today to steal a feather so it will have to do. The Hartley is completely done. I am leaving the old finish. To touch it would ruin it for me. It looks like it has been here since 1929.
Don VE3LYX
I am hanging around 7100 with it. It is putting out decent power so I am hoping to catch someone there.

Lou,
I use an 80mtr dipole up about 70', suspended between two large fir trees. Feed line is a straight drop to the shack.
I feed it with the cheap 450 ohm ladder line into a homebrew antenna tuner with balanced output. I can tune 160-6
mtrs with it. At the old QTH I strung a 160mtr dipole in a slanted diamond shape with the with the ladder line attached
at the highest point. Been doing this for 20 years and it works FB. I've also used a 40mtr flat top dipole fed the same
way, would tune 80-10 mtrs.

Mitchell Watson, W7UZ, is the one who told me about this, he said the antenna acts as a double ended Zepp.
Also, when using an 160 or 80 mtr flat top dipole, the signal is directional off the ends with lots of gain.

John

Or do what I do - used balanced tuned feeders and a proper balanced-output matching network to make your 160M or 80M dipole a multiband antenna.
Hi Larry,

You've bn "pushing" this ant for a long time...and with good reason. My RG-8X is 8 yrs old, maybe time to replace it with ladder line. Which do you recommend resistance-wise?

Also:

Will a 1/2 wave 80 flat top load on 160?

proper balanced-output matching network For example?

Not sure what you mean by "resistance-wise." If you mean you want to minimize the RF resistance of the feedline, you are correct, and I use a line that used to be available from W7FG (SK) made with insulated #16 stranded copper conductors, spaced 4". It may still be available from another source. I run up to legal limit with it and have had no problems - it just works. There is also a "window line" available which uses #14 conductors spaced at 1" that would be a good choice. Window line also comes with #18 conductors - I'd avoid that because if you are going to use a 1/2 wave 80M flat top on 160M (which will load with the tuner I am going to describe) and other challenging (low resistive & high-reactive components at the feedpoint) the losses may be considerable.
> Also:
> Will a 1/2 wave 80 flat top load on 160?
See above. Mine does with the tuner I'm going to describe here, but whether it will or won't MAY be sensitive to the feedline length. My signal is considerably down from the full-length160M dipole, but people in New England still hear me well. I generally use the 160M antenna on 160M for that reason, but it's nice to have a work-around when the 160M antenna needs maintenance. I can't get a match with my other tuner, which is a double pi-net with a 1:1 balun on the INPUT, but works well in every other respect (see http://www.somis.org/bbat.html for the basic design concept). A third alternative is to find a Johnson Matchbox, preferable the KW version, but it will cost you more than building your own, and will need modification to cover 160M.
> proper balanced-output matching network For example?
>
The three options are given in the preceding paragraph. A description of the 1st option follows, copied and pasted from a post I made recently to this group and primarily aimed at Don VE3LYX. Schematic and photo are attached.

Notes:

(1) You can ignore the variable capacitor on the left. I included it thinking I may encounter situations where it would be needed (in series with the input lead) but haven't yet.

(2) the knife switch and micas on the right are for padding on 160M, and when in the circuit connect stator-to-stator of the main variable cap.

(3) My coil is 50' of 3/16" copper tubing wound approximately 6" in diameter because I wanted to be able to handle the legal limit. If you only run low-medium power you don't need anything this beefy. This coil covers 160M - 40M but has too much parasitic capacitance (& resonances) to go higher in frequency. A smaller coil (much fewer turns and probably smaller diameter) would get you there.

" The simple design I use in the cellar shack is an inductor with center-tap
grounded and connected to the input coax braid, with the input coax center conductor tapped 1-3 turns one side from the center (depending on band & antenna in use). A split-stator air variable of about 50 pF/section is used, with each stator clipped an equal number of turns on each side of the center-tap, and the common rotor floating (this is important!). The balanced feeders to the antenna are also clipped an equal number of turns on each side of the center-tap, but closer to the center tap than the leads from the air variable. Tuning parameters are the 5 clips (input coax from transmitter, the two clips from the air-variable stators, and the clips from the feedline), and the setting of the air variable. It sounts complicated, but once you find a match you note it and it's very simple and fast to go back there. You can also feed a single-ended system (random wire, wire-fed Windom, for example) by just tapping on one side of the coil. The design is similar to the classic link-coupled tuner for parallel feed, but instead of the input link you tap a few turns on one side or the other of the coil (which side doesn't matter), and it works equally well without the additional mechanical complexity of the link.

With this system I can tune both my wire antennas, both center-fed, one cut of a half wave on 1060M, the other cut for a half-wave on 80M, each on 160M, 80M, and 40M. I could also use these antennas on the higher bands with this tuner design but would need a smaller inductor. I don't bother because I have a tribander on the tower which I use for 20 - 10M."

73,
-Larry/NE1S

sure...sounds good Larry...how about 10.120 +/- if the wind is blowing. I'll be using my normal station trcvr as I have not converted the TNT to any other bands. The Hull Hartley now has all of the 160m coils wound and as soon as I finish making some modifications to my 2200m kilowatt, I'll be looking for some 160m sked tests.

I spent the morning on the AM rig. I got power up significantly (X4) (although it is still insignificant.) got rid of the hum. (02 accross the diode)
I raised the osc voltage to 112 by playing with osc plate supply resistors. Above that made no difference so I quit there. I played with control grid bias on the final. Wasn't able to improve it so I left it alone. I made a new antenna link. Some improvement but not right yet. Had it monitored from down the road. Good reports so I am going to hang around 7290 and call CQ when it is open. Also phoned Dad and told him I had it working. I told him how I did it. He laughed and said "Lots of thinges work in Radio that havent even yet made it into books. The fun is in trying them. "

Great, Steve! If you want to try a somewhat long haul, I will be happy to sked you on 160m. I have a 590 foot Beverage in your direction. I imagine it would be an awkward hour for at least one of us, though. I would have to use my big modern rig.

Would you care to share details of the 160 meter coils? Pictures, perhaps?

Hi Everyone,

If any of you reading this wants to make some noise on 160-meters CW by way of a sked, count me in...

I'm on the band practically every day now, & plan to finish-up the ground radial field of my 3rd inverted "L" element to-day...hope to have the triangular phased array operational before the end of the weekend.

Hi Paul / John / Eddy - I would be delighted to try for any and all of you on topband once I finish this present project that has been slowly driving me crazy. I've been trying to find the source of a very small arc somewhere on my 2200m kilowatt. I have a couple of things to try today and if I can take care of it, I will turn my attention back to the HH-160 and see how it plays. Assuming no problems (ya right!), I could be on fairly quickly but I really need to finish this bigger job first. Condx are getting better and better and I hope to run some skeds with VE3 on 2200m as soon as I can get the amp to stop it's intermittent 'sizzling' !

Steve / 73

PS - attached is the 160 tank for the plate...the antenna tank is the same only fewer turns. These are a direct copy from the March '32 QST article on building a Hartley for 160. Incidently, Steve, KK7UV, has posted some great old QST information in our files section, on converting your '29 rigs over to 160...probably a very popular project back in the day.

Hi Steve...

"...Ready when YOU are, Quigley old boy!" Hi Hi

I just came inside after laying down the LAST of my ground radials, for the east "L"---all I have to do now is "tweak" the air variable capacitor at the base of each element to the same frequency, & I'm in business (they're not that far off right now, from where I set them 12 months ago).

Steve, the band is just full of its usual surprises: during the CQ WW SSB splatterfest last weekend I called CQ & KH7X answered me (I was using just a single "L" at the time), & this morning one of your brethern---VE7MID, to be precise---was calling CQ from Zone 2 in Quebec...and KH2/N2ML in Guam answered him, with a wonderful 589 signal!

Unfortunately the VE7/VE2 couldn't hear him...

A British Columbia to Ontario QSO should be a piece of cake! : >)

Just let us know when you'll be on, and where, so that we low band denizens of the north-east might lay in wait for you...

For local guys, CW but for anything else pretty much QRSS mode...very slow CW. We are close enough to work crossband mode on normal CW some time if you are able to receive down on 137 kHz. I have worked a few stations in the central states on crossband...me on 2200m and them on 80m CW.

Good afternoon,
While I'm taking a dinner break, thought I'd give an update on the Meissner. I have done some tinkering, this week, and here are a few of the results:

1. I have found it pretty hard to find the 'sweet spot' as far as output and getting it near a specific freq. In the four coil version, there are separate coil/variable condenser combos at the grid and plate. The tank coil is divided in half, ie., in the article, he used 7 turns in each half (5 or 6" dia, 1/4" tubing) of the total tank coil. Each grid/plate coil/cond. combo is coupled into a tank coil half. To my mind, the grid/plate sorta looks like a TPTG config. I had trouble finding the proper setting of the condensers, but finally found a spot where I was getting a sig. out around 3570kc. A ruff sounding sig, but it was there and strong.
2. The last few days I have noticed that the #49 p. lamp (in series with the feed line) would glow, at the above freq, but two f/s mtrs did not show very much output. Finally it dawned on me that maybe the primary sig was on 160m and I was listening to the 2nd harmonic. More thinking revealed that the cotton picking thing was designed for 200-150 mtrs or so. I had the wife pound brass while I went to Studio B and listened on a gen. cvg. rcvr and lo and behold, there it was on 160m (actually 1750kc or so...ooops, but no call sign is being signed yet)...real strong (I was using a 2B rcvr in the shop so couldn't listen on 160m). I took the counter out and sure enuff, got a sig dead in the 160m band.

3. I have gotten the tone a tad better, by dinking with the grid leak & condenser.

4. Now a quandary is whether I keep it on 160 or trim off a turn or two on the tank coils and move to 80m (hopefully that would move it). One-sixty would be great, but I don't have a vry good antenna (using the 80m windom). Also, I'm a tad nervous, operating it so close to the band edge. I'm leaning on moving to 80 so I can see if the thing will get out of the back yard.

5. So far I'm up to 200vdc, 25-30ma on the CX-301A.

Ok, that's a ole buzzard transmission, but that's the latest scoop on Mr. Meissner. Now, back to the tinkering.

73 all, de Bill K4JYS

Yo Lou,
Firstly, a NEWS FLASH: Mr. Meissner is heard 15 miles away.

I phoned a friend, W4HHN, down in Benson and he gave me a report of 10 over nine on 160m...and no sig hrd on 3.6...the 2nd harmonic. He did have some noise of a few s-units, on 3.6, so may have to get him to listen again for a 2nd har. signal. I may move it over to studio B and see if I can make a contact on 160.

I'm gonna go out and make a few pix. I don't know how to send them via the web post option...should I just send them to you or should I try posting, to the list, via email...it may take a few days to come thru that way.

A tickled op at K4JYS

> >
> > 1. I have found it pretty hard to find the 'sweet spot' as far as output and getting it near a specific freq. In the four coil version, there are separate coil/variable condenser combos at the grid and plate. The tank coil is divided in half, ie., in the article, he

used 7 turns in each half (5 or 6" dia, 1/4" tubing) of the total tank coil. Each grid/plate coil/cond. combo is coupled into a tank coil half. To my mind, the grid/plate sorta looks like a TPTG config. I had trouble finding the proper setting of the condensers, but finally found a spot where I was getting a sig. out around 3570kc. A ruff sounding sig, but it was there and strong.
> > 2. The last few days I have noticed that the #49 p. lamp (in series with the feed line) would glow, at the above freq, but two f/s mtrs did not show very much output. Finally it dawned on me that maybe the primary sig was on 160m and I was listening to the 2nd harmonic. More thinking revealed that the cotton picking thing was designed for 200-150 mtrs or so. I had the wife pound brass while I went to Studio B and listened on a gen. cvg. rcvr and lo and behold, there it was on 160m (actually 1750kc or so...ooops, but no call sign is being signed yet)...real strong (I was using a 2B rcvr in the shop so couldn't listen on 160m). I took the counter out and sure enuff, got a sig dead in the 160m band.
> >
> > 3. I have gotten the tone a tad better, by dinking with the grid leak & condenser.
> >
> > 4. Now a quandary is whether I keep it on 160 or trim off a turn or two on the tank coils and move to 80m (hopefully that would move it). One-sixty would be great, but I don't have a vry good antenna (using the 80m windom). Also, I'm a tad nervous, operating it so close to the band edge. I'm leaning on moving to 80 so I can see if the thing will get out of the back yard.

Lou, here is a short tour 'bout the board:
On the right, the small adj. coil & the DX condenser is for the plate circuit; to the left, the small coil (pivoting on the beehive) & Cardwell, are for the grid circuit. And the tank coil is divided into two sections. The antenna just clips onto the tank coil...no B+ so no need of going thru a condenser. In front of the tube are the grid leak resistance and condenser.

Probably won't be on 160 tonite. I'll need to do some more tweaking and then move it over to Studio B where I have a rcvr that covers 160. I'll post a notice when I am gonna give it a try.
Tnx, Bill K4JYS

Thrusday, Nov 3rd, my copy of the AWA Journal arrived out west here.

But last week I received a package from the AWA that was about twice

as large as the Journal.

What a supprise to find this (see attachment). I had no idea!

I must thank Bruce Howes, W1UJR for is encouragement and editing.

And thanks to everyones kind comments when I first posted photos of

the TX here last year.

Paul, I expect you will need the Bev. and a preamp to hear me..hi.
There was a guy down your way whose call I cannot seem to remember just now, who ran a 1 milliwatt beacon on 160 a few years back. I want to say his call was N2 something, but I'm even positive of that much. He did have a 160 meter inverted L antenna, but that 1 milliwatt was very readable here when there were no storms and the ionosphere was quiet. I'm sure your Meissner is making considerably more than a milliwatt and even with antenna considerations I think my chances of hearing you are pretty good if the ether cooperates. :-)

Congrats, Bill!

You may want to consider putting up an antenna for 160M.

One option would be to leave Mr. Meissner on 160M and build a doubling PA
for 80M. No neutralization necessary! Meissner MOPA has a nice ring to
it...

Thanks Steve,

That's the one. I would have been using my old crop of receive antennas in 2005, not as good as what I have now. We should be able to make transcontinental contacts on 160 with our '29 rigs when conditions are just right.

Hi Larry,
Now that I know it can be heard on 160, I'm leaning toward leaving it on top band. I will try the 80m Windom first and see if I can make any distant contacts. I can probably string up another Windom for 160, but will be thru some thick pine trees. I haven't dipped the grid/plate coils/var. cond. combos yet, but if they, by chance, dip in the 160 & 80m band, maybe all I will need to do is make 80m tank coils. And the MOPA does sound like a good idea. I ran across a MOPA in a later 1924 QST that looks like it could make a good project...but one thing at the time..hi. I continue to be surprised at how tuff the '01A is. I'm getting about 6 watts input with this one. If the Meissner works out, I may also try two '01As in parallel..73, Bill K4JYS

Hi Guys,

If any of you are hankering to try out your 1929 rigs on 160-meters, now would certainly be a good time to do just that...

I'm up & on the band practically every day from about 1000Z on, & believe me, the area from 1800- to 1810-KHz is practically no man's land---completely empty & devoid of DX, as well domestic QSOs. It's the perfect "playground" for experimenting, calling CQ, etc. And you're far enough away here from "DX Alley" (roughly 1814- to 1835-KHz) that nobody should be bothered by your presence, either...

Give it a go, if you have the hankering...and do NOT worry about he fact that your OT rig is, by comparison to modern outfits, "...QRP." There are a LOT of 5-watt stations to be heard & worked on Top Band, and quite readily, too...

~73~ de Eddy VE3CUI - VE3XZ

PS: One caveat about 1800 - 1810-KHz---W1AW conducts its evening code practice on or about 1802-KHz during weekdays: you wouldn't want to stray too close to them, on risk of REALLY drawing some negative publicity to Old Tyme Radio...!

Possible design change.
I have been off and on exploring the use of a harltey or TNT as a regen as well. (transceiver) In the process of this interest I discovered that the regen in this AM rig which is a hartleystyle gives off a pretty good signal when regen control is way past regen and into full tilt osc.Snce the osc of thisstyle fo circuit is sovery stable I am thinking on nix ing the Tx/s osc which is almost the same and using that section instead for a RF amp for the rx osc when on Transmit. This would allow me to provide the final with some more badly needed drive and I have some spare room in modulator's amplitude that might cover it. I am still thinking but it shouldn't require huge changes.(pull the coil, feed the grid maybe?)
BTW this regen has a RfFstage in the front end so there goes that theory that it prevents signal except maybe they are not going out the antenna but just in the shack radiation.

4222. '24 Meissner Power Supply

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-06 13:54:15 UTC
From: cwopr@embarqmail.com
Topic: 4222 Message: 4222

Now that I may have the Meissner prototype close to working, I have begun thinking about a suitable power supply for the finished product...should it go that far. I would like to use a period correct supply or at least as close as I can practically and reasonably get it...no modern 5Z3s, 280s, 1N4004s, etc. Some of the options available in 1924 would have been:

1. A rectified & filtered p/s using 'S' tubes--now unobtainable and costly back then.

2. Chemical rectifier and filter condensers--nope, but used a lot in the '20s.

3. Raw AC on the plates--not a nice note but do-able and would be for AWA use only--- also was used a lot & low cost.

4. A dynamotor--they were used and sold by ESCO--moderate cost then? Also MG sets were used, but not practical now even if available.

5. Any others? Were there any rectifier tubes, other than the 'S' tube?

I'm thinking the dynamotor would be the best solution and close to the original technology and could be used for normal amateur QSOs. It would probably need to be a 12vdc version and guess I could run it off a car battery and charger. I expect the note would be 'unique'. Any thoughts.

73 & Tnx, Bill K4JYS

UX-213

There've been a few on eBay (very few) that went cheap. Much cheaper than a UX-280. Apparently not much demand.

Good luck with the power supply Bill. I'm having quite a lot of difficulty trying to scare up the right stuff for a proper 1929 power supply. (actually I've given in and willing to use 1930s stuff but even that is 'bout as common as hens' teeth :-)

Green is good, but I don't care what color if it is #22 d.c.c. !

I'm building a 160 / 80 meter receiver from November 1929 QST. I just checked the math and the 60 feet called for in the article is on the high side. 65 turns total on a 2.75" form is about 47 feet according to my math.

If you can part with that much I'm still interested in 60 feet or so just to be safe. I will be making a minor change in coil form diameter. I figure the safe approach is to start with a couple extra turns and remove turns as/if necessary.

Paul, did you try PTOP.

Thanks for the suggestion Bill. I did but he only had s.c.c. in that size. I bought some as a fall-back. I'm sure it can be made to work but since I'm changing the coil diameter slightly I prefer not to change the wire insulation thickness and turns per inch also. Chances are I'd be just fine with a little math and experimentation but I got nervous about it and have been holding out for the d.c.c. wire.

However I am expecting a package (my fourth) from PTOP tomorrow. It will get me a notch or two closer to completing the receiver and the TNT power supply! :-)

It is an Amrad basket variometer, it was separately boxed for tuning, could have been part of an Amrad panel receiver.

It is desirable, Alan Douglas may have a drawing with it boxed.

Regards,

Chas

I need some help here. I have designed and built a Rf amp for my am set but I am not sure I have it right. Some of you are very good at such things (I am just learning) It is a mid thirties tube 50C6 which is basically a HD 50L6 with slow warm up. I added a cathode resistor and caps (only had two of he three he recommended) and now the tube doesnt run away on my but I am not showing power out or at least not much. Would some mind taking a look and making suggestions. It is possible my tank is not quite right tuning wise although I built it from specs for 40M. I checked by feeding it direct from my exctier and it was not impressive on tuning. It makes me suspicious i am not where I should be. I dont have a Grid dipper but I do have a HF signal generator. Resistors are 6800 ohms for cathode, 10K for screen , 56K for control grid. Power is 281v underload .

From: cwopr@embarqmail.com
Topic: 4251 Message: 4251

Good Morning,
In fiddling with the Meissner I have found that it has a few spurious sigs and both the 160m & 80m (just got a sig on 80, but not sure if its getting out) 2nd harmonic sigs are pretty strong..locally. So far no 160m 2nd harmonic sig has been heard up to 15 miles away, but more tests are needed. I am feeding the 80m Windom directly to the tank coil. If I were to put a parallel coil/var. condenser in the feed line, tune it, with a gdo to the band in use, would that reduce the harmonic and spurious sigs getting to the antenna? Would that ckt have any detrimental effect at the antenna? Any comments appreciated...tnx

> Don VE3LYX

Hi Don,

Your cathode resistor looks WAY to big. Since this will be a linear amplifier, you want to be biased for class AB1 or AB2 (you'll get a bit more power out of class AB2 but you will need to replace the grid resistor with an RF choke to ground if you go this route. Otherwise, you'll have to run class AB1 and make sure you don't drive the PA into grid current - a 1mA meter at the grounded end of the grid resistor would tell you that (positive terminal of meter to ground, negative terminal to bottom of grid resistor).

You will want as "stiff" screen supply so suggest you use a variable power resistor (wirewound pot or resistor with slider tap) as a variable voltage diver for your screen supply, and another variable wirewound resistor of around 1500-2000 ohms total as your cathode bias resistor. They are both variable because you'll probably only find class A biasing conditions for the 50C6 (that's all I could find) so you'll need to experiment with screen voltage and cathode bias resistor values, and one will affect the other. You might start with around 750 ohms in the cathode and adjust the screen voltage until you start to draw about 5 mA of plate current with no signal on the grid, and start there.

Honestly, though, a 50C6 in linear service is still only going to give you a couple watts of carrier output at best (maybe 10W on CW), and setting up a linear amp for AM operation is going to mean the output from the rig your driving it with needs to be capable of maximum carrier output for tune up, and then throttling back to ~20% of maximum for AM operation (I'd do this by making the screen supply variable on the screen-modulated AM rig).

Once you do this, take measurements of everything (cathode voltage, screen voltage, plate current, RF output power) under both maximum CW output and

resting carrier output in AM mode and report back.

73,

Hi Bill,

You might put a parallel resonant circuit tuned for the harmonic (80M) IN SERIES WITH the feedline (band pass filter), but the more conventional way to go would be to use a pi-net (low-pass filter) tuned for the fundamental, or a parallel tuned circuit for the fundamental from feedline to ground (also a bandpass filter).

What I do is configure all my transmitters for low-Z output (either link coupling, taping way "down" on the plate tank coil, or pi-net out) and then feed either a low-pass (pi-net) or bandpass (the tuner I described here last week) network to feed the antenna.

I did discover the capaitance of the tube thorws off the tuning of the output tank. (removed power and the tube and fed it backwards thru ant link. At 7200 cap was at 75% open (25 % meshed.) I installed the tube and did nothing else. With cap full open it is just starting to affect so is still about 1/4 turn from on freq. that I can deal with however am still needing advice ithink.

Thanks Larry,
I have a variable screen supply on the rig so I am good there. I can fix the cathode resistor right now.. A couple of watts carrier would make me smile. At least right now. I will do the fixes and check back. The project is an experiment in Screen grid midulation and transciever construction. The modulator works good but the thing lacks punch. Anything I learn here at almost zero cost can be applied later on to a bigger one. Thanks , I'll git right to it. I have a ton of patience so i can poke way till I get it. Would a 6L6 be a btter choice? I have 4 of them.

A 6L6 would be better, but even better than that would be a sweep tube
like a 6CD6, 6DQ5, or even a 6DQ6 (or one of their variants with a
different heater voltage).

Looks like condx are fairly depresssed here this afternoon...10m started off with great signals from Europe but everything seems to have fallen off fairly fast. I don't see any sign of flaring but with the huge sunspot group coming into full swing, things are bound to be disturbed eventually. I'll keep my fingers crossed but am not hearing a lot of 30m sigs at the moment.

Ok I switched tubes. Still a 7AC pinout so minor PS change. Couldnt find my 6L6 s so I have a 6V6 in the hole. Found a shorted disc ceramic and repaired that.
Put the power too it loaded got +236 plate B+, --226 cathode, +195 screen and 0 volts on grid . Amp is working. Output rises on the meter as the tube warms up. %wise quite a bit but still not a watt output into the antenna, I am down to a 6.8 k grid resistor. Making progress but still a ways to go. Grid resistor change or?

As I feared Larry, condx were pretty bad and only became worse towards sked time. The frequency was very quiet right up until our sked when there suddenly appeared a lot a stations in a pileup calling someone up a few kHz. ...even the guys in the pileup who were presumably running some normal amounts of power, were weak and watery so it looks as if condx are turning auroral...possibly another CME impact. Hopefully we can try again when the band comes back to normal. I don't usually operate much on 30m but will try and keep an ear on condx and give you a heads-up.

I am learning and making progress. Got grid voltage (measured cathode to grid) -10.7 Plate curent was 26ma. So i bypassed the cathode resistor(400 ohms). Plate current was 49 ma and watt meter showed slightly more that doubled output. In the morning I will reduce that but not to zero as with the by pass but to a small value. Then I will measure the cathode to grid voltage again and will see what happens if I half the grid resistor. (add one in parallel which is easy now to do.) I know the tube could stand a large increase in B+ voltage as max safe rating for continuous use is 375 so 400 would be a cake walk for it in intermitent service.. Thanks Steve for getting me started along the right path and Larry for your help today. It is starting to make sense. Tomorrow I will look for my 6l6s in daylight.
BTW tank circuit now tunes properly. I removed 3 1/2 turns.

Yeah, I heard the DX and pileup on 10.120, so I called from 2100 until
about 2115 on 10.117. Then another QSO muscled onto that frequency (it
doesn't take much muscle; I'm only getting about 1W out to the antenna
from the TNT on 30M) so I called for another 5 minutes or so on the next
clear frequency up, which was 10.126. No auroral quality on the sigs
received here, though.

OK, we'll try again when condx improve. Thanks for the attempt.

73,
-Larry/NE1S

PS - Tried sending this last nite, but could only receive and not send -
my ISP's SMTP server was down. I guess it's working again.

???? Cathode should have around 10-20V on it, and be positive with respect to ground. We are talking zero-signal (idling) conditions, right? If not, RF may be getting into your meter giving you erroneous readings.

Since you shouldn't be hitting the tube hard enough to draw grid current anyway, I would go with a large value for the grid resistor, say 100Kohm.

How are your coupling the AM TX to the 6L6 grid?

Glad you are making progress, Don.

But, I said it before and this is VERY IMPORTANT. For linear operation (which is essential if you are going to be amplifying anything other than a CW or FSK signal), YOU SHOULD NOT DRAW ANY GRID CURRENT OR DEVELOP ANY GRID LEAK BIAS. The grid bias has to come 100% from the cathode bias resistor or a separate bias supply. At -10.7 grid bias and ~200V on the plate it looks to me like you are in class A conditions, and you can't run any less bias than that. (You shouldn't reduce the cathode resistor any more, or your linearity will suffer and you risk cooking the tube.) You want a higher bias voltage to run class AB1 or class AB2, which is more efficient than class A and has the potential for more output, but you need more drive from the exciter to take advantage of that. If your output is going up by reducing the bias from what appears to be class A conditions, and you want to maximize the power output capability of the 6L6, it means you are starved for drive; you need more output from your exciter. But that is why you are building your amplifier in the first place! You can't just optimize for "max smoke" and think you have a workable system.

The more practical way to do this is to just use a bigger tube and more voltage for the screen-modulated PA, and forget about linear amplification. I have a 6CD6 screen-modulated rig I designed and built, and I get about 10-15W of AM carrier out of it, or 40 - 60W CW, depending on the band. The plate voltage on the 6CD6 is 760V, plate current is around 120mA (CW conditions). But now you are talking about a more elaborate rig.

So I should optimize with what i have then, use it as a learning experience and then build another with a big tube. I never played with those although I made a SSB linear years ago from a pair of X250s ceramic metal tetrodes. Sold it a DXer. It worked but would occasionly pop the meter when you switched meter modes. I never liked hi power. Had a viewstar linear too. Never had the guts to push it above 600watts.
Would you have a schematic for your am rig? It would interest.
The problem getting more push from the RX TX is that being screen modulated in the final there is a balance between enuf screen voltage for carrier and enuf screen modulation (AC) to keep the modulation working properly. Screen voltage even total with modulation is low for the 50l6 but the modulation works well so I am hesitant to monkey with it. I have a working transciever for am . That was my goal. Probably and I may be wrong but I think if the osc AND the modulator had another amp , say another 12sl7 with each using half again then I would have more osc drive and more modulator AC to impose on the screen grid.I could run the sreen voltage up then and the set would have more stomp.
I built it AC dc (transformerless.) I have though, and this might be a solution, tested the TX section of my rig at 228 volts. It performed well and there was a substantial (a relative term of course) increase in output. So i could build double for the tx B+ and then see what results.
Anyway I wish to thank you for your help so far. I was lost there for a bit.

Thanks Larry...I tuned all around thinking you would probably have moved from .120 but nothing heard from you. With just one watt, it will take great conditions.

> No auroral quality on the sigs
> received here, though.

Interesting. For some reason back here we seem to be affected worse for geomagnetic / auroral disturbances than the east coast. I guess we're a little closer to the magnetic pole.

I've a type 800 that works fine in my Hartley but I'm not certain of the introduction date. It doesn't show up in the ARRL Handbooks until 1934 but it may have been available from RCA before that.

Does anyone have a more complete reference of 1929 RCA transmitting triodes? Can you check on the 800 introduction date for me?

Thanks,
Niel - W0VLZ

That looks very much like Jim Fred's work and may well have been one of his. It has the standard 6-pin (tube-style) pin arrangement, though, and is not the SW-3/SW-5/FB-7 style base.

Back when Jim Fred was manufacturing coil forms Ocean State Electronics used to sell these, as well as the SW-3/SW-5 forms.

> 180pf cap from my tx's ant link.

This could be why you aren't getting enough drive. The link is a low impedance (low RF voltage) feed, and the 6L6 grid wants more voltage and is high-Z. You could try a resonant L-network on the 6L6 grid (series inductor, and variable capacitor from 6L6 grid to ground across a 100K grid resistor, or another link-coupled coil in the 6L6 grid circuit (80M parallel resonant circuit with a couple turns for a link which is connected across the link from the exciter).

Oh, OK. I didn't read that far. Excellent, it will be good to have another source!

I wonder if he also does the pin arrangement for the SW-3 style, because the one in the photo sure looks to me like there are two large pins and 4 smaller ones. The SW-3 style has 6 small-diameter pins, and they are not equally-spaced.

4293. RE: Harmonic Reduction

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-08 17:56:21 UTC
From: JAMES HANLON
Topic: 4251 Message: 4293

Bill,

Regarding harmonics from your Meissner, I presume it's a Signal Shifter, I can make a few suggestions.

First off, the "final amplifier" in a Meissner Signal Shifter is generally operating as a doubler, except perhaps when the output is on 160 meters. So you might expect to have a somewhat higher level of harmonic output than if the stage was operating as a straight-through amplifier. It definitely is operating as a doubler when the output is on 80 meters.

If you want to use a parallel tuned circuit to reduce the harmonic output, I would suggest that you configure it as an "antenna tuner." Select the inductance and variable capacitance to resonate on the band you wish the rig to transmit on. Attach the feed line of the antenna to the two ends of the coil, and wind a link around the center of the coil and attach the link to the output of the Meissner. Tune the capacitor for maximum output from the Meissner to the antenna. If you need an output indicator, put a low current, low voltage pilot light bulb in series with the antenna feedline and tune for maximum brilliance in the bulb. Short the bulb out after you adjust the tuner to avoid power loss. You may need to adjust the number of turns on the link to get proper loading, and you may need to tap the antenna feed line down on the coil for proper loading as well. A little cut-and-try will get you to a satisfactory point.

I use a tuner much like this with my Meissner Signal Shifter and my other rigs, and it works well. In addition to the parallel tuned circuit, I put a second variable cap in series with the link and I adjust the tuner for zero SWR or zero reflected power as looking into the link/cap port of the circuit. That gives me a 50 ohm load for my transmitters. I use my Signal Shifter on 80, 40 and 20 meters, and I have never had a reported problem with its harmonics.

Another thing you might want to do if you are worried about harmonics is to put a low-pass filter in the line between the transmitter and the antenna or antenna tuner. There is a series of "half-wave filters" that can be built for your band in use that are particularly nice. They were described in the November-December 1949 GE Ham News which may be available on line, and they are also described in many of the Editors and Engineers Radio Handbooks. They are relatively simple, and they offer the same load impedance across their input terminals as appears across their output terminals. They attenuate the second harmonic about 30 dB, the third harmonic about 48 dB, the fourth harmonic about 60 dB, the fifth harmonic about 67 dB and so on, increasing at a rate of about 30 dB per octave. An individual filer requires just two inductances and four capacitors. I can send you a description of the filters from my Radio Handbook if you like. I use a group of these filters with a Collins 32RA transmitter on 80 40 and 20 meters. The Collins rig has bad harmonic output, and these filters allow me to operate it safely.

Hope this helps.

Jim, W8KGI

Attachments: 1 described; binary payloads are missing from this source WARC

This drawn from memory so I might have missed a cap or resistor but it essentially the complete tx circuit i put together. The modulator credit goes to Bob Weaver. I stole the basic idea from him..I use a carbon mike and battery. (Warning NOT drawn in tubepad)
I am satisfied now and I also had thought that another LC circuit couping identical to the tx output would do a better job of coupling as a cap is not too efficient or well matched. I may find another film canister and wind another coil/link deal. Need to find another variable cap too but there is Kingston Hamfest this weekend. For now on a quiet day atmosphereically i am confidentI could be heard. Power into theant or into the load is identical.
Thanks.

Hi Jim,

Bill built the Meissner oscillator circuit from the 1920s. We're not talking about the Signal Drifter (at least not THAT one ;-)). Mike WU2D had an article on it in last year's AWA Review.

Don, I may be wrong but I think you need a plate load resistor in the modulator circuit. Or maybe move the variable resistor to the other side of the plate connection.

Leonard

Sent a reply to Jim, but forgot to reply to the group so here 'tis:
Hi Jim,

Tnx a lot of all the info, however, the Meissner in question is a homebrew four coil Meissner osc from a 1924 QST. It runs a CX-301A tube. I built it as designed, so the coils are for the 150-200mtr range. After a bit of twiddling, I have a pretty good sounding sig. (yes, of course it has just a bit of chirp and ripple but not bad for a 1924 rig.). It is very stable...only moved +/- a few hundred cycles during the cq-a-thon. It was heard 15 miles away, but 2 hrs of CQing, the other evening, yielded nothing but a tired hand, so don't think its getting out. The antenna is a 80m windom, so I'm gonna have to come up with something closer to what it was designed for. I attached a couple of pix of the hay-wire version. Hope I can get it going so I can use it in some AWA events. Your info is very interesting and I can put it to use...many tnx and 73 de Bill K4JYS

With the move from 7040-7050 to 7105-7115 for the BK is there any similar thought/discussion going on with respect to the Linc Cundall in January?

It seems like the same argument applies...the the RTTY and digital stations have taken over 7040-7050 to the point that it isn't very useful to us.

Rather that squeeze all of the 40 mtr LC contacts into 7030-7040 why not add in 7105 to 7115?

Niel - W0VLZ

Thanks Leonard. I missed a cap too in the modulator .I will redo it next time I have it out of the box making sure I deal with that resistor as well. . Then it will be right for sure the same. It is a fun radio. Good for SWLing ok for CW (I will improve that.) and good on AM. I have to add a CW switch in the tx section to bypass the modulator stuff so the screen of the 50L6 can have full voltage. It has been a very interesting and educatonal experiment.
NEXT? I started on a HD antenna coupler this afternoon. On wood of course. Airplanes are aluminum, Real radios are wooden.

Bill,
Been there . I thought my 50L6 rockbound rig wasnt working. Some fellows over at regen group where I met Leonard (BTW Leonard I have this regen also squealing ;>))Suggested a sked. Ist Qso was your state and I was heard in Maine too. Then Uncle Lou volunteered a sked and it wassuccessful although it was a very noisy night(QRN). I would not get discouraged. I well remember getting my ticket (code only at first) and pounding brass with my Viking II till my wrist fell off almost (they didnt have karpul tunnel back then just "suck it up") My Tnt puts out a decent signal (a couple of watts)but I have yet to have a qso with it, My Hartley is showing 12 watts on the meter which is the highest of any of my homebrews and it has never been heard either. Which is why we need a net for our old tube vintage style low power rigs. No long QSO or such just a log in and sig check to make sure we are all making RF. Twice a month or something like that so it isnt a huge burden
That is what I think anyway. If you got 15 miles then you are getting out. You know all this I know but I feel you need some encouragement. Id listen for you at the drop of a hat even if I dont have 160. Actually I do (TS830S) I forgot.

While I agree the circuit looks unconventional, I concluded that a plate load resistor for the modulator is unnecessary as the current drawn by the PA screen grid itself serves as the load.

Yes, please, let us know when you'll be on, Bill. I have my mighty Tri-tet using a type '59 ready to go on 1802. (I guess I'll be limited to a time when W1AW isn't there, but I can listen for you, anyway. Or I have other rigs I can get on with.)

Bill,

Please announce to the group exactly when you'll be on 160 the next time...

I have a pair of K9AY low-noise receiving loops for the band, as well as 1500' Beverage---if that fails me I can always listen on my 3-element phased transmitting array...you're BOUND to make it through on any one of those, I'm sure...!

Keep us posted as to the specific "whens", and "wheres."

Morning Don,

Yep, skeds sure help and if I thought I would have had any chance at all of making any distant contacts, I sure would have done that. At the moment, the Meissner is working into a 80m windom. I figured that the tx is maybe putting out less than two watts at the very best, the antenna was very poor for 160, the band was noisy, too, so didn't see much of a chance for a distant contact. When I tried the NC stn, who I usually work with no problem and he didn't hear me...that told the story. I am very used to long 'cqing' periods. My novice log is full of cqs with no answer..hi. I run all vintage and HB tube gear. The HB gear is mostly one tubers and low power so I have done plenty of calling with no answers. When I get something that might work better, I'll put out the word. Oh, I had a pretty good 'cq' session, on 80m, last night with the '29 TNT...no contacts tho. Thanks, Bill K4JYS

PS: Also have a Viking 2/vfo and a HQ-170 that I use quite a bit on 160.

>
> Bill,
> Been there . I thought my 50L6 rockbound rig wasnt working. Some fellows over at regen group where I met Leonard (BTW Leonard I have this regen also squealing ;>))Suggested a sked. Ist Qso was your state and I was heard in Maine too. Then Uncle Lou volunteered a sked and it wassuccessful although it was a very noisy night(QRN). I would not get discouraged. I well remember getting my ticket (code only at first) and pounding brass with my Viking II till my wrist fell off almost (they didnt have karpul tunnel back then just "suck it up") My Tnt puts out a decent signal (a couple of watts)but I have yet to have a qso with it, My Hartley is showing 12 watts on the meter which is the highest of any of my homebrews and it has never been heard either. Which is why we need a net for our old tube vintage style low power rigs. No long QSO or such just a log in and sig check to make sure we are all making RF. Twice a month or something like that so it isnt a huge burden
> That is what I think anyway. If you got 15 miles then you are getting out. You know all this I know but I feel you need some encouragement. Id listen for you at the drop of a hat even if I dont have 160. Actually I do (TS830S) I forgot.

I just an on air test with a guest op I coherced into coming here searly morning. . I took a reciever and dorve away to a place where I like to check my signal. I could hear the AM rig fine. Good audio, no hum . It was in fact stronger there then zu hause So on some clear good morning when 40 is great I will be on. Generally if I am strong at my signal check point I can be heard "out there"

GM Bill,

If you can be heard 15 miles away you can be heard hundreds of miles away. It's a matter of right conditions and right station at the other end. I'm not claiming to be the right station, nor am I attempting to rush you. But I can tell you there are guys who can hear a pin drop in China on 160 and then there are the ones who can't hear a kilowatt 10 miles down the road. ;-) Of course you probably know your local guys and their station capabilities. Keep plugging away.

Without that resistor in the modulator, the plate is at DC as far as audio goes and there will not be any audio to couple to the screen of the PA. I believe Don just forgot to draw it in. 73 - Mike

While I agree the circuit looks unconventional, I concluded that a plate load resistor for the modulator is unnecessary as the current drawn by the PA screen grid itself serves as the load.

Lou,

I built the TNT transmitter shown in the Nov 1930 issue of QST. Since it is a 1929 design and uses 45s or 10s it qualifies for the BK. See
http://www.prismnet.com/~nielw/tnt/tnt.htm and

Same TNT design I use, except I clip the antenna feed to the plate tank with a 0.02 mica rather than the (relatively speaking) elaborate balanced link coupling in the QST article. It was published as such by Shuart in a 1933 Radio Craft and then again in the 1934 Official Short Wave Manual (Gernsback).

And although I used 45s for years, I now have a pair of 71As in the sockets as they seem to be even more efficient at BK power levels.

I also heartily recommend the design.

I don't have a reference for a PP Hartley handy, but I know I've seen it done before.

Thank you.

Like you Larry, I have seen a P-P version, but do not seem to have the info here. We considered a TNT, but I've never built a Hartley so thought this would be the time to do so. Jim, imagining a Party winners award on his shack wall, insisted on using a pair '45s.

Perhaps someone could draw the ckt including the usaual 20 ohm filament resister.

With the 6V6 (havent found the l6s yet.) Power with the amp is way up. I spent some more time playing with all the values keeping in mind the limits you set out for me. The monitor recvr can no longer hold the signal out . Even yesterday it could. Now with atten on and Rf gain at the bottom lowest possible setting. It is still pounding through. My watt meter is no good but it does show improvements. It is swinging the needle pretty high compared to even a day ago. The Amp idles with no drive nicely , nothng overheating (no smoke even!) The tuning on it is very sharp or touchy. I may put a dial cord deal on it since it has a pulley and that will give me some better tuning abilty. I am quite happy with how it works now. It is a tiny little deal smaller than a kleenex box but is working well. I hard wired everything about a hour ago and retested. Worked the same so I didnt mess anythng up. I am just trying to firure out how to make it pretty (cause it sure aint right now!) When my 6l6s come i will push the B plus up and hopefullyget some more. but I know right now on a good night without a lot of QRM and QRN I could be heard. The signal was very nice. No fuzzyness, no hum. Almost broadcast qualty although I hesitate to go that far. I(could see nothing wrong with it whatsoever. I am tuned up on 7290 and have tried a couple of stanfing bys but it is a busy place and I hate to make a nuisance of myself.

http://electronbunker.sasktelwebsite.net/OneTubeXMTR.html This was the circuit I took the most of the modulator and beam power section from.
I took a lot of liberties but I did use the neon bulb and modulator circuit (except I used a electo mechanical circuit to feed the modulator grid.) I used a 12sl7 and a 50L6 instead of a compactron but that is niether here nor there just a packaging thing. I used my RX s hartley style design for the osc because it does not respond to hand capacity in anyway and is rock stable. Hour on hour and after overnight cool down as well. I used a conventional tank with an ant link in the 50L6 plate. As you know it is more or less a transceiver as it has a recvr Regen with an identical coil and tuned on the other gang of the main tuning capacititor. 4 tube tranceiver . The fact that it is only an exciter is ok for me. I now have a neat little Amp to mate with it. It was a big step for me off the beaten path. I changed a lot , experimenting with individual circuts for days till I figured them out but it works. When I got lost you folks stepped in to help. I can ask for no more. If I want a higher power version I will build it with 811s and a 813. (Rerlax I dont.) If I had it all to do over I would add a 12sl7 betwen the first and the 50L6 to boost modulator and osc signals both. However it works and I am happy with that. Someday soon I will have a qso with it and life will be good. My biggest dilema is I have no hams near me 15 to 30 miles who would have an interest in a signal check for me. My brother has a nice 5101 Navy rvcr in his basement and lives a few miles away. He said someday he should listen for me. I know by then I will be pushing up dandilions from my grave. "Someday" isnt worth a pound of salt. Ta-day is what counts.

GREAT!

> busy place and I hate to make a nuisance of myself.

You'll have the best luck answering a CQ. Just keep the receiver on 7290 while you putter about the shack. I forget if your rcvr half of the project drives a speaker; if it doesn't feed it into an audio amp that does. Or monitor 7290 on a separate receiver with a speaker if that's not possible. Sooner of later someone will call CQ on the frequency and that's when you pounce!

We may be able to try for another sked on Friday morning at 9:30 EST (I'm booked tomorrow).

I also saw your request for the schematic of my screen-modulated rig. See the relevant links on this page:
http://www.amwindow.org/tech/htm/pw.htm

But there are simpler screen-modulated schemes than what I used - mine was kind of an experiment that worked well using what I had to work with, but at the price of some complexity.

4326. Windom Questions

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-10 00:54:38 UTC
From: cwopr@embarqmail.com
Topic: 4326 Message: 4326

Good evening all,

I'll say right off...this is a bit lengthy and possibly confusing...my apologies.

Today has been another head-scratcher down here.

As most of you know, I have been using the classic off-ctr feed hertz or Windom for a number of years. You may also know I use a pilot lamp (#47 in this case) in series with the feed line as an antenna current indicator for tuning up (tune for max. brightness). The first Windom I put up years ago was by the graphs in the Dec 1929 QST article on the Single Control Transmitter, the TNT. All worked well and generally still does. But a few months ago I put up Windom #2 and built per the 1929 graphs. When checking it out I noticed that I no longer got an indication of ant. current on the series p. lamp (using the '29 Hartley). Perplexed, I took down Windom #1 (my original) and measured it. For some reason it was longer than I thought it should be (and longer than the graphs) (copper wire...probably stretched), but it lite the lamp good. I re-built #2 the same as #1 and with the same feed point and presto the lamp was back to burning..about the same brightness with either antenna. (Note: both Windoms are for 80m). Today I decided to try again...trimmed down #2 to the '29 graph specs...same thing, no indication of ant. current. The orig. (#1) Windom still causes the p. lamp to glow nicely. On the Hartley, I use a loosely coupled coil/variable condenser combo...adj the cond. for max lamp brightness. The ant. feed line is clipped to the coil.

This gets even more confusing, to me at least, due to differences in the graphical dimensions between the referenced article and subsequent handbooks. I can go into that later.

My first question: is the series p. lamp giving me a true indication of ant. current..ie the brighter, the better. Is my 'instrumentation' giving me the right skinny?

If the p. lamp is correct, than I have a few more questions re. the dimensions.

More later if youse guys can stand it. Tnx, 73 de Bill K4JYS

4327. Hull Hartley on 160

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-10 01:20:06 UTC

This afternoon I finally got some time to try out the 160m coils that I wound for the HH a couple of weeks ago. It seems to work well, with and easy 12 watts out at 400 volts and keys acceptably. I'm always surprised at how well Hartleys want to oscillate...this one will oscillate with as little as 13 volts on the plate.

I have attached a pix of the HH just before plugging in the tube and power supply. As well, I have an .mp3 audio file on my web site of a sample of the on-air keying.

http://members.shaw.ca/ve7sl/hh160b

I'll spark-up after dinner for a few CQ's around 1805-1810 if anyone will be about.

Steve

Gosh, the keying from that rig sounds BETTER than lots of kilobuck "mo-dern" rigs that I hear on the band...

Congratulations!

Probably around 0330Z or a bit earlier...2230 in VE3.
Not sure how condx are but listening down on the ndb band and hearing a nice signal at the moment from 25 watter MDS in South Dakota on 400kc so condx can't be terrible.

It was just great to work you Paul and on my very first 'CQ' with the HH on topband! When I heard the reply I thought...great...at least they can hear me in W7 land. I just about fell off the chair when you sent your call...what a great signal back here. I may get on a bit later this evening but so far you are my only QSO....there is very little activity down at the bottom...both a blessing and a curse I guess.

I found your circuit not long after that request. Neat rig!
I found a circuit on a German site that used the carbon mike in the cathode in place of the cathode resistor and had the audio transformer in the plate circuit. It said you could develop 30 volts audio with almost any triode. I might try that next. Sorry but I am fiddling Friday Mornings. Maybe the weekend.
Yes the rig has good audio and drives a speaker. It is a relfex regen so to speak and uses the Rf amp twice , second time through as audio amp driving the 50L6. It s a pretty good rcvr but it has hum on the recvr side that interferes with my low level signals and the regen circuit. .I suspect a lot of that comes from my transformerless supply and if I can find 2 12 volt transformers down in the junk I will isolate it and see if that helps. I have kind of ignored that for now as I laboured on the Tx side of things but it is a good radio from an SWL standpoint and has good audio but if I use earphones the hum is objectionable.

FB Eddy - I haven't been watching the prop on 160 so far this fall as we keep getting whacked by the sun with CME's every other day it seems...these really keep 10m hopping but do just the opposite on 160. Maybe the DX guys have all moved to 10 and aren't watching the band as much...who knows. We were due for another hit to arrive sometime in the overnight or morning hours today so perhaps it arrived already. We were certainly spoiled with those two long solar-quiet winters on 160 and I don't suppose we will ever see conditions like that again. There were many nights out here in B.C. that all I could hear were Europeans on 160...no U.S. signals at all, and some of them before our sunset. Up until a few years ago (after being on 160 since 1974), I had never even heard Europe on topband and to hear them at 599 levels night after night was astounding to me. It was during this time that I obtained a beautiful SW-3 and set about winding a set of 160m coils for it. When I fired it up around 1700 local time, to see if it worked, the first station I heard on it was a UA1 calling CQ. Once in a lifetime conditions, I suspect.

My first question: is the series p. lamp giving me a true indication of ant. current..ie the brighter, the better. Is my 'instrumentation' giving me the right skinny?

Hi Bill,

I haven't seen any replies from the more knowledgeable so I will take a crack at this. I have never used a Windom so am certainly not an expert on that antenna.

The lamp should be giving you a relative indication of antenna current, therefore the brighter the better for a given antenna length. I feel certain the feed line on a windom operates with significant standing waves. If the line were long in terms of wavelength, you would find points along the line were current is maximum and voltage minimum. These points would be one half wavelength intervals, but the "first" one might not be at one half wavelength from the antenna. If you were to move the lamp along the line, you would find it glows most brightly at these spots. Half way between those points, current would be minimum and voltage maximum. The lamp might glow much more dimly or not at all if placed at one of those points.

When you change the length of the antenna you change the impedance at the point where the line connects to the antenna, and hence standing waves on the line. The position(s) of current minima and maxima along the line change. So with the shorter antenna your bulb may be closer to a current minima point and thus not glow as brightly (or not glow at all). If you could move the bulb along the line... and if the line is long enough so that it happens to have a current maxima somewhere along it... you might find a spot where the bulb glows brightly.

It MAY be possible that your transmitter and line coupling system doesn't transfer power to the line as efficiently with the shorter antenna and hence different impedance at the transmitter end of the line. I will leave that possibility for others to delve into.

Bill,

Your pilot light bulb should be giving you a valid "measurement" of current at the point where you have it inserted. If there is a standing wave on the transmission line the current will vary depending on where within the line you measure it. That may be what is causing the bulb not to light with antenna #2.

If you send me the dimensions of both of your antennas and feedlines I will model them with EZNEC. That may help to understand what is going on.

Hi Paul and tnx for responding.

I just love ham radio and have been at it a long time, but me and antennas just don't get along. I can build them from articles, charts, graphs, etc. and if the SWR is right and they work, then I'm happy. If anything goes wrong, then, some of the time it throws me for a loop. In the case of the Windom, all was well until I built up the second antenna. It didn't follow what the graphs showed. The end result was that I had two Windoms that were physically longer than the charts said they should be. But I was getting good brightness on the p. lamp. So I began to wonder about my ant. current indicator...was the indication due to ant. current or a SWR problem. I knew that placement of the indicator could effect the reading. A pilot flying IFR that doesn't trust his instruments is doomed....thats me..hi. So Thurs., I put Windom #2 back to the same dims. as the orig. (#1) antenna. Then I decided to run the Hartley around the 80m band for max. brightness...that point was up around 3.65mc. I lenghtened the antenna even more..now its about 4 feet longer than the charts say it should be...but the antenna current is pretty much maxed out around 3570kc. I can make contacts and get pretty good reports, so I'm leaving it as is..for now. I also started on a rock-crusher of a 160m antenna for the Meissner...a Windom at about 30ft high....more like a dummy load. Enough of this for a while....maybe more when I get the 160 wire strung thru the trees...tnx and 73 de Bill K4JYS

Yes Paul...that was me 'swishing' about on the very low end. Your heads-up operating made the entire conversion project well worth the effort. I hope more guys will move down to 160 for the second weekend and for sure, next year.
I would love to hear your audio file when you take care of the homefront Paul.

See you on the 6m ON4KST chat...also watching the F2 muf's daily climb here...great fun every 11 years. The highest I've seen so far this cycle is Spanish on 45 mHz. I did manage several VK's and the FK8 a couple of weeks ago on a post-auroral muf spike...all well after sunset. Probably not pure F2 but certainly involved somewhere along the linkage.

4358. Antenna tuner.

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-11 21:06:24 UTC
From: Don
Topic: 4358 Message: 4358

I managed to avoid building one since before I got my ticket when I did build some for SWLing. Now I need one more then ever so I set out on a build. First I made my antenna tuner pocupine. (see my photo albumn here. "Ater".
Now most of its mounted. It is going to take some time and patience to hook up the porcupine to the 16 postion vintage switch I have but I will do only a couple a day so I dont get anzy. I am building it so several style can be accomplished by switching but first off is gong to be a simple pi circuit.

Hi Jim,
Tnx for the EZNEC offer. I'll re-measure the antenna as soon as it warms up a bit and let you know. From the old late '20s articles, there should be no swr on the feed line when it is tapped to the proper point on the antenna. There are several graphs which give the dimensions for various bands. Seems simple enough. But there seem to be some differences in the graphical results and the formulars provided....a bit confusing. I'm gonna do some more reading and probably tweaking on the antenna. Tnx, 73 de Bill K4JYS

From: N1BUG
Topic: 4360 Message: 4360

I still have precious little radio time but in between other duties and stress testing the eBay search system I've been researching a few things. I have some questions I've not been able to find answers to. I'd like to run some of them by all of you.

First question:

I have a NOS "mahoganite" (black/brown) hard rubber panel which has a number of scuffs and minor scratches. Is it possible to buff these out without destroying the surface shine? If so, how?

73,
Paul N1BUG

4361. 160-Meters

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-12 12:46:30 UTC
From: Eddy Swynar
Topic: 4361 Message: 4361

Good Morning Gang,

This morning on 160-meters I heard a VERY distinctly 1929-sounding CW station---warbbley, jumpy, unstable, etc.---making the rounds at the bottom of the band, hastily working most anyone the operator could hear...but I was suspicious when I heard him tell one station that he was running 100-watts output.

Hmmm...

Anyway, I called CQ myself, & lo & behold that very station came back to me, & so I asked him what sort of "...old tyme" rig he was using. Turns out it was NOT an old time rig at all, per se, but rather, a Drake TR-7. The PTO in that transceiver had obviously developed a life all its own, just like the one in my own T-4X has---and the PTOs of many other Drake owners, too, sad to say...

That has to be the major "weak link" in Drake tube-type gear, i.e. the PTO...just like the dials are the Archille's Heels of the Heathkit "SB" line-up...

Thank goodness such anomalies in signal quality are merely taken for granted & are accepted as being "...de riguer" in our 1929 set-ups! Heck, we'd be suspicious if they sounded like modern rigs, than what they actually do!!! Hi Hi

GM,

There has been a lot of very interesting circuit & antenna talk lately. Haven't much to add to that except for this scan from a September, 1920 QST.
It is a lengthy article covering the circuits of the day plus HV power sources.

Pse see photo album, VE3AWA.

Hi Guys,

There's an absolute MUST-HAVE book up on eBay right now that NO self-respecting homebrewing Ham should be without in his radio library:

http://www.ebay.com/itm/Arrl-Handbook-LOT-Single-sideband-Understanding-Amateur-Radio-ham-rf-transmitter-/190600181828?pt=LH_DefaultDomain_0&hash=item2c60a7f844#ht_637wt_1165

I'm referring, of course, to the one on the RH side of the view, i.e. the FIRST edition of the ARRL's UNDERSTANDING AMATEUR RADIO. It is a GREAT little book that has all the low-down & the nuts & bolts on making your own VFO, AM modulator, etc. A simply wonderful edition...

Speaking of antennas, I went to Kingston hamfest today. I bought a leader LIM-870 Antenna Impedance meter.($20) I really dont know how to use one since I never had one and there are no instructions. It appears though to be NOS. Even had an almost good battery in it. It said RFin on two posts and Antenna on the other two. I marker crystal osc i made a few years ago for spotting my regens. I just clip an crystal in the alligator clips , push the button and instant low power RF. Only 40M crystal I have is 7350 (I have ten of them !) SO I clipped on in and hooked it up. I assume (yes I know what assume means) That you tune for the null and read the impedance. I hope I am right. My inverted L for 40M which my AM set is on tested 74 ohms impedance at 7350. My inverted Vee currently hooked to Mr Hartleys invention tested 47 ohms impedance at 7350. Maybe I am wasting my time building a ant tuner?

> Maybe I am wasting my time building a ant tuner?

Here's an easy answer to your question Don. I'm assuming that you have some form of SWR bridge or forward power meter as you have often quoted your power levels. If you are seeing the exact same set of conditions (plate current / forward power reading) while running your tx into a 50 ohm resistive load as you are when running the tx into your antenna system, then the answer is yes...you would not benefit from a tuner and in fact, might even lose some power depending on the efficiency of your tuning system. If you are not seeing the same set of conditions, this is an indication that your antenna system is reactive and not purely resistive, the ideal situation, and would benefit with some tuning to eliminate the reactance. If the difference is very small, then I would ignore the tuner.

Leonard,
Thanks ofr the booklet, I have it saved here. I was relieved to see I guessed right on how to use it. It is a pretty slick piece.
Steve I understand what you are saying. Since especially my last test produced identical power results from my dummy load and the antenna then my antenna could not be significantly out of wack otherwise there would be signifcant difference assuming my dummy is good . From Leonards kindness in sending me the manual I see I guessed right how to use it so my results are valid However since the antenna tuner is about 3/4 done my square headed heritage will not let me not finish it. However the pressure is off.
The Am rig is working better all the time but i still ahvent had a QSO. I have some fellows from the Am net are going to give it a try tomorrow on 7120 in the early afternoon. This Am thing has captured my intrest at the moment.
Thanks both of you. It has been a great week. I have learned a ton of stuff beginning with stand alone rf amp design to Impredance measuring etc. I had bid on a batch of 6l6tubes on Ebay but got smoked at the last minute. I figured I would just buy one et the Hmafest. No such luck. I figure the 6v6 could stand 350 volts plate . I will se how I make out tomorrow and go from there.

FB Don...and yes...I have 400V on mine in the Longfeller and can get 8 watts out of it on 10m CW...it is a great little tube. The 6L6 will give me 12 watts out under the same voltage / drive levels.

This is a neat design with solid 30s roots. Works great for the AWA LC Contest. I built mine to look more like a Gross CW-25. See
http://w0vlz.blogspot.com/search/label/1934%20transmitter

I'll be interested to hear how well it works on 20. Bill Orr only claimed 160, 80 and 40. Collins, on the other hand put the same design on 20 (in the Collins 4A) by shifting the biasing on the 46s for that band and doubling in the final.

Depsite something going goofy with my audio I managed a QSO with VE6PG in Hanover Ontario this afternoon a 2 oclock. I thnk in my excitment (and I was !) I had far too much carrier and was smothering the mic to boot. He said he could hear me but my audio was barely readable. He gave my carrier an S7 but my audio less than half that. I will figure it out. I just checked it here as well and it a bit crackly. It wasnt before so i have done something worng but at least the rig works. I personally am totally cranked. It could be I set everything too high in hope of insuring a contact. So now that it works it s time to perfect it.
Don VE3LYX
BTW Steve thanks for your 6v6 vrs 6L6 comments. You answered a question I hadnt yet asked.

Changing the bias on the #46s, which way? And how do you get the final
tank to double?

John

_____
[AWAGroup@yahoogroups.com] On Behalf Of Niel - W0VLZ [w0vlz@...]

This is a neat design with solid 30s roots. Works great for the AWA LC Contest. I built mine to look more like a Gross CW-25. See
http://w0vlz.blogspot.com/search/label/1934%20transmitter

I'll be interested to hear how well it works on 20. Bill Orr only claimed 160, 80 and 40. Collins, on the other hand put the same design on 20 (in the Collins 4A) by shifting the biasing on the 46s for that band and doubling in the final.

73,
Niel

From: N1BUG
Topic: 4393 Message: 4393

Here is a question I really hope someone can answer, even if the answer is "forget it".

Is it possible to shunt a 1920s thermocouple type RF milliammeter to extend its range? Every time I think I know the answer, I read something that causes me to question it. It seems obvious it could be done if one did not care at all about accuracy. It is less clear to me whether some reasonable degree of accuracy could be maintained. Part of the problem is I do not know if the end-to-end resistance of the thermocouple changes in proportion to the current flowing through it.

Even if it is otherwise possible, one problem I see is getting a fractional ohm resistor that doesn't have significant reactance in comparison to its resistance, which would make the reading change with frequency.

Comments, please?

73,
Paul N1BUG

$4.75 in 1926 had the same buying power as $58.16 in 2011.

And 4.75 was a cut-rate price!

I seem to recall $7.00 being the usual...

$7.00 in 1926 had the same buying power as $85.71 in 2011.

Tks Steve.

Paul - I'm not sure what 'type' of RF ammeter the one in my Hull Hartley is but was originally 250ma FS. I just measured its resistance and put a shunt of the same resistance in parallel with the meter and it seemed to do the job nicely. Now instead of pegging the meter at 250ma, it pretty much stops at about 500ma when running full power on the HH.

Your mileage may vary :-)

Maybe he moved there after getting the callsign?

I've talked to him before on 40M.

There is another VE3 very active on 40M AM. I can't recall the callsign suffix right now, but his name is Nick, and his accent suggests he's originally from Great Britain. If Don spends any significant time on 40M AM I'm sure they'll meet up.

I bought a ST '10 at a Hamfest for $5 about 7 or 8 years ago. It was a good tube. That's the good news. The bad news is I haven't been able to locate it for the past year or so, and I've searched my tube stash extensively looking for it. I don't remember giving it away, but I may have.

One thing that would cause this is too much voltage on the screen grid of your screen-modulated stage. You want to set it for about 20% of maximum RF power output, which should be about 40% of the screen voltage which provides maximum RF output. This is because you need "headroom" for positive modulation peaks - the PEAK RF power (and RF voltage, and current) under modulation is the MAXIMUM CW output of those parameters the modulated stage is capable of.

Hi Leonard,

A bigger meter in series would help with calibration if I had one. These things are very scarce in any practical range for my power level.

Paul

Paul, you can use a regular DC ammeter for calibration. Those should be easy to find in your range. For the frequency range you are going to be using it, the calibration will be close enough. Since the RF meter's thermocouple does not really care if it is DC or AC heating it up. 73 - Mike

Hi Leonard,

A bigger meter in series would help with calibration if I had one. These things are very scarce in any practical range for my power level.

Paul

On 11/13/2011 08:01 PM, Leonard Meek wrote:

Paul, why don't you put a bigger ammeter in series with your meter, and then adjust the shunt until it reads what you want. Then remove the bigger meter.

Great Britain.???????! I'll try and behave then. I intend to spend a lot of time there. They have a regular get together on 80 AM but came to 40M so I could try a qso with Tim. Very nice of them I thought. My RX Tx has plug in coils so I could wind a couple for 80M guess. Probably just double the turns would get me there .I suspect myPA would tune there as well. It is atabout 80% open on the variable cap when on 40M at 7120 I also used a double ganger and put a hole for a switch to switch in the second gang if I needed extra C. Might work as long as it likes it. Today I am on the hunt to get the HUM out of my detector when the circuit is only lightly loaded as with weak signal. With strong signals it isnt a problem at all but with weak ones it produces a garbled sound. I notice that my Tx also if the modulator is not turned up into the grunt zone has a bit of Hum if the rx is nearby although even at the road which is 100ft away it seems to disappear. I am thinking if I put a stiff load resistor in the circuit it might actually pull the peaks down enuf to make it go away. I have enuf C in the PS to choke a horse (40uf) in three sections so that isnt the answer. I tried a input choke but it didnt make any decernable difference, It is transformerless supply so I put an isolation Transformer in the cord just to see. it changed the sound but didnt cure the problem.. In fact it was worse. (Sharper) I have it now on a capaitive isolator . That is a big problem with a regen detector, hum . What makes them good makes them bad as well. Anyway Rome wasnt built in a day. I know now the set works so I will just have to sort it out even if it means building a serious audio quality PS.
Don

Yes I can see that clearly on my output meters and even on the neon lamp that is in the screen circuit. I did some tests last night with a reciver near my garage which is way on the otherside of the house.. As I lowered screen voltage so as to give room for a balance betweeen Rf and AF in the txs final tube the volume of the audio rose remarkably even though the strength of the signal (total power did not change under full modulation (peaks were the same as when I had too much carrier) I was trying too hard yesterday when I made my first QSO .Now that I am over that I can learn to run this rig properly. I am though having a huge amount of fun and as Martha S would say "That's a good thing". Yesterday I used a commercial Rx to listen. I wont be happy till I can QSO totally with this set. I have to trim the rx freq a tiny bit as I am just side steping my Tx freq very slightly. My tuning cap has places for compression padders but there are none installed. I have to search my junk to see if I have any I can steal. Which ever side is too high will get a padder. or trimmer. And I have to get this hum low enuf that the detector isnt sensing it over the weak signal.

How does a "6" end up in Ont.? Maybe he moved there after getting the callsign?

In Canada, you move to a new province, you get a new call. Sounds quaint doesn't it?

Maybe that's changed.

Lou

John,

I've uploaded the schematic of the the Collins 4A here: http://www.prismnet.com/~nielw/1934XtalXmtr/Collins4ASchemetic2.JPG Keep in mind the 4A was one of Collin's first transmitters and it was introduced as a low cost transmitter. It didn't even have the switch to silence the oscillator when receiving.

When operating the 4A straight through the output of the PA stage was tuned to the output frequency of the oscillator and biased with the 300 ohm grid bias resistor. This is pretty close to Bill Orr's design. On 20 mtrs with a 40 mtr crystal the 4A added an extra 2000 ohm grid bias resistor so that the PA stage generated a lot of harmonics. The output of the PA stage was then tuned to pick off the second harmonic. Power on 20 was speced to be about half the power on 40. Doing this some 40, 15, 10 mtr signal got through also but this was 1934 and we are talking about a low cost transmitter. I would not double in the final today.

BTW, by 1934 the 59 tube had been introduced along with the tri-tet circuit and made into a single tube transmitter by George Grammer. See March 1934 QST page 8. This transmitter worked well on both 40 and 20 using a 40 meter crystal. To put Bill Orr's 1934 transmitter on 20 I would try replacing the 47 oscillator stage with a 59 tri-tet.

Interesting that they used two separate power supplies, one for the oscillator and the other for the PA. I wonder what the real reason for that was, as this is a crystal controlled rig. 73 - Mike

Thanks for the info Neil,
I'll keep the '34 rig on 160-40 and build something for multi band operation on the higher freqs.

Weren't Tri-tets hard on crystals?

From: AWAGroup@yahoogroups.com [mailto:AWAGroup@yahoogroups.com] On Behalf Of Niel - W0VLZ

John,

I've uploaded the schematic of the the Collins 4A here:
http://www.prismnet.com/~nielw/1934XtalXmtr/Collins4ASchemetic2.JPG Keep in mind the 4A was one of Collin's first transmitters and it was introduced as a low cost transmitter. It didn't even have the switch to silence the oscillator when receiving.

When operating the 4A straight through the output of the PA stage was tuned to the output frequency of the oscillator and biased with the 300 ohm grid bias resistor. This is pretty close to Bill Orr's design. On 20 mtrs with a 40 mtr crystal the 4A added an extra 2000 ohm grid bias resistor so that the PA stage generated a lot of harmonics. The output of the PA stage was then tuned to pick off the second harmonic. Power on 20 was speced to be about half the power on 40. Doing this some 40, 15, 10 mtr signal got through also but this was 1934 and we are talking about a low cost transmitter. I would not double in the final today.

BTW, by 1934 the 59 tube had been introduced along with the tri-tet circuit and made into a single tube transmitter by George Grammer. See March 1934 QST page 8. This transmitter worked well on both 40 and 20 using a 40 meter crystal. To put Bill Orr's 1934 transmitter on 20 I would try replacing the 47 oscillator stage with a 59 tri-tet.

John,

Depending on the tube and power level the tri-tet oscillator is hard on crystals. I don't know how bad Grammer's 1934 design is. I'd bury a pilot light is series with the crystal for protection.

I understand not wanting to cobble up your 1934 transmitter. Another, less drastic change to consider is to just change the PA bias resistor and then use your 1934 transmitter to drive another stage/amplifier. This was common 30s practice and led to rack mounted "progressive" transmitters. This is how I eventually plan to get my 1934 transmitter and TZ-40 amp (http://1.bp.blogspot.com/--DU030G3CTg/TrqNOhsyRoI/AAAAAAAAAcY/E5x-Pm5GNkc/s1600/FinishedXmtrSm.JPG) onto 20 mtrs.

Oh, I like the transmitter and amp Neil! Got a schematic?

Yeah, I could build the '34 rig into a rack mount... pwr sply on bottom, exciter in middle and amp on top.
And I have a pair of TZ40s and HY40Zs too. Could also use a pair of 211s.

How about plate modulating the final?

John,

The 1934 47/46 transmitter deck is described at http://w0vlz.blogspot.com/search/label/1934%20transmitter. The push-pull TZ-40 amp deck (work in process) is at http://w0vlz.blogspot.com/search/label/TZ-20%20RF%20Amp Both of these links are into my blog so you have to read from the bottom/oldest entry.

One of the advantages of the progressive design is that you can build the sections you want. A modulator deck for the PA would fit right in. Then you would ready for the AWA AM QSO Party.

I spent the day working on it. I have the rec hum down a lot. There was some coupling to the coil from the varicap plates when they were at their 90 degree position . I made a shield from ALM . Tried a few other deals None successful. other than the shield which did take the garble out of the weak signals and cleaned the tone of CW signals on recve. Then i rebuilt my AMP. I call it Mighty Mouse AMP. . . It isnt very big but it works. Now for some quite 40M days noise wise.

Never busted one in mine.

I've heard the critical thing is to short out the tuned circuit in the cathode lead when not frequency-multiplying in the plate circuit. In other words, if you want output on the fundamental xtal frequency, it ceases being a tritet and becomes a regular plate-grid xtal osc when you do this. When frequency multiplying, as long as you get the cathode tank right, no problem (YMMV). I've always heeded this advice, and like I said, I never lost an xtal in it.

From: Don
Topic: 4436 Message: 4436

I just mapped my homebrew rigs freq with its 1930s tubes and parts. (case anyone forgot it is an oldie.)I discovered I have a tribander. tunes from 3.6 to 13.2 mcs. Checked both rx and tx and it works all the way.
That gives me 80M 40M and 30M (although I would have to do CW there I guess.) The tank in the rig needs a switched padder (only 100pfs wide spaced TX cap so I would need to add at least 200pfs to 265pfs) to get down to 80M but the coil is not significantly different than the osc coil so it can be done easily. I have the rx working pretty good now and am sitting here listening to a Shortwave station at good volume my other rxs can barely hear. I made more progress today than I realized.

NEWS FLASH: Mr. Meissner works GA and VA.
Here are a few details:
For the past few days, I have been stringing up a 160m Windom at about 30-35 feet high...almost a dummy load...I thought. I got the feed line hooked up today and could hardly wait for dark. I started out about 7:30PM, CQing, with no results...QRN level was high. But finally I called another stn in VA and got a RST 579(?)...don't think he ever got my call completely correct. Then a stn, NX4V, in GA called and we had
a 45min QSO, 599 both ways...I almost fell out of the chair. I cked the meter on the Meissner...200vdc at about 12ma..using a Heathkit bench supply for B+. The stn in GA said the rig was extremely stable. So that's a quick report, more later...as soon as the QRN drops, I'll be ready to try you guys up north.

Niel,
You've inspired me! Dug through the junk boxes and mocked up this (see attachment)
Have lot of the parts on hand tho there are a few odds-n-ends I'll need. Tubes in photo are the HY40Z, similar to the TZ40.
Yeah, that's an 80mtr BC-610 coil in the final tank. The input will use Bud OCL coils.
The National neutralizing cap is a bit over kill, just threw it on there to see what it would look like.

Do you have a parts list for your schematic? I'd like to see values for components.

John

4471. Bills HB corner

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-16 13:17:18 UTC
From: Don
Topic: 4471 Message: 4471

I took a tour of your HB corner this morning , Bill. The Meissner is a neat looking deal and obviously works well.
Today is antenna day at the farm. I plan to double the height of my 40M inverted L. I strung a rope much higher through the tree yesterday with a makeshift deal. Today the XYL promised to hold the ladder while I tie the antenna from the old postion to the new rope so I can raise it. (She may not bring me a beer but there will be a hot choclate and some applecrisp afterwards I am sure.)
This morning while reading a chapter on A and AB amplifiers for SSB I came accross a piece about adding higher voltage to tubes. It actually said most tubes used in ham radio could stand double their factory rated voltage and while some might not it would be immediately obvious.(ZZZZZZZZZZZZZZZZZZZZZZZZ??????) It basically said one just has to try and see. (1956 ARRLhandbook , small section on SSB.)
I can run a class C with AM I believe. Not much activity on AM since sunday. I give it a shot though a couple times a day.(7120MHZ)
I am also rebuilding one of my old Power supplys using that old Hammond transformer from the Grimes radio. Should be able to get 700 B+ if I float the centre tap and use a bridge. I am hoping it has a 6.3 filment winding too but if not the PS already has a stand alone 6.3.
I should wind up with 350V 700V and filment supplys of 2.5 , 5v and 6.3
With a cap input filter I can get some more B voltage. 400v + under load.
Don VE3LYX

John,

Looks good. I don't know if RF feedback will be a problem. If so, it may help to rotate your input coil so that it is perpendicular to the output coil.

For values I used the TZ-20 page out of the 1939 Taylor tube manual. See http://4.bp.blogspot.com/_svHaMoEDgIg/S4IYz41YnEI/AAAAAAAAAR8/MR2uLiVNbug/s1600/TZ20RFSpecs.JPG Taylor recommended grid bias resistor for PP TZ-40s is 1750 ohms. Elsewhere in that manual I found Taylor using .006 mica caps for filament bypass. I was surprised by the recommended plate tank cap size...only 80 mmfd on 80 mtrs.

73,
Niel - W0VLZ

GM Don,

Tnx for looking at the pile. When I get thru dinking with the Meissner, I will rebuild it on a more suitable board and dress it up some too. I may try a pair of '01As in parallel to see if I get more power out. The board its on now has been used many times for prototypes of most all my one tubers..its full of holes..hi. I have been working on antennas quite a bit lately as well. The wx has been just right. I have a lot of pine trees and most are in the way. The 160m Windom looks more like a 35 ft high electric fence...I'm using fence insulators nailed to some of the trees. This year I bought a 'potato gun' type device for launching lines into the trees...just pump it up with a hand pump or air comp...and it will thro a lead weight & line up pretty high...works nicely. However, I think in the end I'm gonna have to get a tree trimmer out here to thin out the limbs and a few trees. The hot choc might be the best refreshment....beer and climbing might be a bad combo...hi. When I'm climbing, my xyl usually stays in the house and listens for the thump and is ready to call 911..hi. Yes, we hams are always pushing the envelope (tube that is) and try to squeeze out more juice. I usually run about 200-225 vdc on the '01As here and saw the other day where a guy back in the late '20s ran 1000vdc...I ain't going that high. You are a busy ham and I enjoy reading about your projects...keeps me inspired.

I hope the QRN level will soon abate some and I can get back on 160 with the Meissner. Sure hope we can work on some band before long. Good luck with the antenna work...73, Bill K4JYS

John,
Looks good.
Tnx!

it may help to rotate your input coil so that it is perpendicular to the output coil.
Gud point! Also, thot abt putting AL foil on bottom fer gnd plane to shield exciter.

I was surprised by the recommended plate tank cap size...only 80 mmfd on 80 mtrs.
Mine is 100 mmfd per section. Shud work gud.

Tnx Niel,

John

Only on the modulated or preceding stages. Any amplification after modulation has to be linear (class A or AB*).

*when they talk about "class B" linear amplifiers, they really mean class AB, since no one runs at a conduction angle of exactly 180 degrees. A conduction angle of less than 180 degrees is no longer capable of linear amplification, so they all run more or less on the "AB" side (> 180 degrees).

Thanks Bill. I have some tree trimming to do but #6 shot is what I'll be using. I played with the Q of my tank in the PA today. Gained nothig but experiance. 40 was nice this morning but I couldn't get a comeback..I got most of the antenna stuff done. Just got to fre one snage and it is how I want it. I worked on my pocupine antennna tuner today. The Porcupine coil is all mounted and the switch wires run and fastened in place. I should be able to finish it tomarro other than paint. I have been thinking of building a pemanent protoyping board. A tube socket in the middle surrounded by 8 brass screws each connected to the socket pin in front of it. me sitting there with 8 jumper wires. With a filment suply and a basic B+ supply one could do a lot of develoment And then build it pretty afterward.

After working on the antenna yesterday I spent some time workng on the tuner I am building. I finally got the porcupine coil all wired as you can see. I have to mount the Pl259s on a piece of aluminum and connect that to the variable cap frames. Run a wire from the one side of the switch to out and to plates of tail end cap and do the same on the inside then I am ready for the test. I also put a terminal on the switch to feed a series cap (which is coming out of my TX tank when the single gang 365pf arrives.) That will allow me to put a cap in series as well instead of the coil. I was wondering if I will be able to rig a twin lamp SWR deal in the ant tuner . I know it isnt 300 ohm flat line but I would be able to get or make a coupling somehwere in it . I even have about 50 feet of 300 ohm anyway. Gotta be a way.
I have been playing around with my AM tx as well. I changed the grid input to a . 01. Power doubled on the meter. I bypassed the link and fed that 01 direct. At one point I had 2 watts out. I know what I really need is another link, coil and variable cap in the amp but that will have to be the Mark II model. "No room in the inn" on this one. My inverted Vee is coming down. It is a piece of crap. Why I dont know but it is about uselss. My inverted L while not perfect is probably 100 times the antenna. I have often thought of a 40M vertical. (marconi) antenna. They seem to work extra good here. I have one on 20M with my Kenwood TS830S and it is a rare day I cant crack a pile up barefoot.

Subject: [AWA Group] Is it possible...

Here is a question I really hope someone can answer, even if the answer is "forget it".

Is it possible to shunt a 1920s thermocouple type RF milliammeter to extend its range? Every time I think I know the answer, I read something that causes me to question it. It seems obvious it could be done if one did not care at all about accuracy. It is less clear to me whether some reasonable degree of accuracy could be maintained. Part of the problem is I do not know if the end-to-end resistance of the thermocouple changes in proportion to the current flowing through it.

Even if it is otherwise possible, one problem I see is getting a fractional ohm resistor that doesn't have significant reactance in comparison to its resistance, which would make the reading change with frequency.

Comments, please?

73,
Paul N1BUG

I'm getting all screwed up with this computer thing.
Paul, what I meant was, to use your multimeter to calibrate your panel meter shunt. Amps is amps, and they don't really care what meter you're reading, as long as it's DC amps. The thermocouple meter doesn't care whether you're reading DC or RF amps. So calibrate the panel meter with DC and then reconnect it to your circuit.

Today I tested the Transmitters power into the amp. It is actually pretty good and differs little from the transmitters power into the antennna tuner when tuned up. Most of my troubles are antenna related. Its time to sit down and build a real good one. Of course now with this tuner I could probably use the flag pole even however that wouldnt be "honest" I am really curious why my inverted Vee on 40M is so bad. I have not tried it on the tuner yet but it shouldnt need one. SWR is good . Impedance measured 47 ohms at 7350 but it will not load properly . It works on my Kenwood but that may be by brute force. Anyway my AM project is nearing completion. Just a few minor things to take care of. I think I am going to build a vintage staion set up down stairs and leave my Kenwood up here for DXing.
This Antenna tuner and its sucess caught me completely off guard. It works so well I am nervous. I wonder if I may be dreaming and will awake to find it isnt real. But every test is good so far. I need a permanent power level indicator of some type in the tuner. I was concerned about SWR for a bit but figure if the antenna is loading right that is the real criteria. I am leaning towards a flashlght bulb Rf indicator. Switchable of course. Meters are hard to come by.

From: Leonard Meek
Topic: 2434 Message: 4501

I have an old Hickok multimeter that I would like to restore. It's a klunker but I have a sentimental interest in it. I used one like it when I was a Fire Control apprentice at Pearl Harbor 60 years ago. It uses a single D cell (I think) for the ohms scale. Like so many other meters of the day, it failed to measure AC ohms, and a number of the scaling resistors were burned beyond recognition. I got the volts and mA scales working but I need a schematic to find the values for the ohms shunts. There isn't any model number on it, except for "Model 955" on the meter scale. I don't know if that's the model number of the whole meter or just the meter movement. The number doesn't lead to anything, and Hickok says all their old records were scrapped years ago. The meter movement is beautifully balanced and holds its place regardless of position. I have several other old VOM's that I use when working on old equipment where the specs list voltages taken with meters of 20K Ohms/Volt or less. Digital meters will give a higher than normal reading in these instances because of their high impedence. If anyone is familiar with this Hickok meter, I would appreciate some info on it.

Leonard

4502. 1929 dial lights

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-19 22:21:53 UTC
From: N1BUG
Topic: 4502 Message: 4502

Oh, no! Can it be another dumb question? Yes, fellows, it would seem so.

Reading April 1929 QST at 2:30 A.M. (!?) I came across an idea I think I would like to incorporate into my power supply. It recommends using a six-volt dial light as a fuse to protect '81 rectifiers in the event of filter condenser failure [or other catastrophe, one presumes]. I find it an interesting idea. The article says the lamp will light to full brilliance at 150 to 200 milliamperes.

Can anyone educate me about six-volt vintage dial lights? Did a six-volt, ~150 milliampere dial light appropriate to the period have a type number? Or otherwise how would I know if I were looking at one? Am I likely ever to be looking at one? In other words, are they out there to be had? It is hoped such a beast would have a miniature screw base... since I've plenty of sockets for such.

Thanks & 73,
Paul N1BUG

Bill. I tried a rf loop like I use in my crystal controlled rig but in the antenna tuner by the input side of the coil but got nothing. You mentioned you had your indicator bulb in circuit and switched it in and out. Is it in the centre conductor wire in series? What size bulb.? I have a 1.2 v and a 2.7 as well as a 6.3 . I can access that wire easily as it goes right by the front panel with in an inch or so. I would like an in house indicator cababilty in the ant tuner if possible so I dont have to leave the power meter asssembly in line too. Too many cables and pieces. If the deal you have would work for me I would be interested in how exactly to do it.

Hi Paul,

Although I'm not sure of their birthdates, the miniature lamps such as those by Mazda came in various voltages and currents.

Type 43: 2.5v bayonet 500 mA

Type 40: 6.3v screw 150 mA

Type 44: 6.3v bayonet 250 mA

Type 46: 6.3v screw 250 mA

Type 47: 6.3v bayonet 150 mA

Type 51: 7.5v screw 220 mA

There are probably others, but sounds like you're after a 40 or 47.

This is a 1930 lamp installed in my 1929 style hartley So I dont have to turn the lights on to copy CW. I bought a spare bulb at RS and cant see any diffference in appearance whatsoever. I took the old bulb with me and matched it in appearance and voltage. The screw in bulb holder and the wiring for it are right out of my early Grimes set. I wired it into the heater circuit. I have a 1920s rheo in the circuit so the bulb is wired before the rheo. The reason being I want to be able to use 2.5 v and 5v tubes in this rig so I dont want to have to change the bulb if I switch tubes and net heater voltage. None of my 20s radios have bulbs. Why I dont know but by 1930 they were seen. Someone will know better than me when they first appeared.

Hi Don,

I use a pilot lamp, usually a #47 or 49, depending on your antenna current/output power..see old handbooks for ratings of diff. lamps. I use a knife switch to short it out after tuning, otherwise the heating of the lamp and thusly the change in resistance will cause chirp in the rig (at least the Hartley and TNT do..the 6A6 does not..depends on the circuit). I use single wire fed Windoms on all the HB rigs and its just in series with the feed line. I have recently had some questions about what I was reading...antenna current or lamp brightness due to swr. I am still working on that..have had other irons in the fire. Small ant. couplers like the Heathkit AC-1, the Lysco and maybe other low power couplers use a neon lamp to indicate output..just tune for max brightness...Bill K4JYS

Thanks Don. I will take up the issue of lighting at the vintage operating position soon. I have managed to steal a few hours lately to work on construction of my operating table, which is now complete except for finishing. I shouldn't have spent the time on it with so much other stuff to do but it is a high priority project too. I need to get it in position so I can complete my vintage parts storage area. There have been treasures arriving almost daily which are wanting for a safe place to reside until I get around to building radios with them! This insatiable desire to build vintage gear is an incurable disease, right?

I suspect bulbs would not have been popular so long as sets were designed to run on batteries. It seems A batteries ran down plenty fast enough heating the tubes.

Leonard,

I suppose I don't really care when it was born but would like to see if it looks the same (size/shape) as whatever equivalent was available in 1929. I'm too much of a purist for my own good!

On the other hand, I've already cheated on the power supply since I'm using an early 1930s transformer. It was too good to resist, new old stock and the right voltages.

I had wondered about a neon lamp but didnt know how to rig it. I found a circuit similar to what you have on line so I would think there is nothing wrong with your set up. Since I use a marconi style ant I think then if I wire the lamp in the centre conductor which goes to the vertical wire it should work. I am curious over the neon deal though. Thanks Bill.

Steve, I had seen the spy radio one then was on that site as well. Seemed like a great way to do it and while mabe not perfect good. Now for the 64$ question Where is my neon Bulb? I had bought several as my Tx uses a neon bulb in the screen modulation circuit (which is a wonderful visual indicator of modulation %) I had one left and saw it yesterday all curled up. never taken out of the package. I cant find it tonite!
What i really worry abiut is that somehow despte my good readings and the way the tuner tunes nicely and the Power meter swings to the high side and wiggles dudtifully on modulation that somehow I will find the readings false. It seemed too easy just building the tuner and installing it that I would be able to get hat much extra. I am hping it will work but I am nervous. Sked tomoorow 2 to 230 pm on 7120

Still cant find my neon. I saw it thurs or fri so it ticks n me off! However. I took my field strength metr and put a cliplead around the centre contuctor 1 1/2 times on the Ant end of the tuner. It works perfectly. If it wasnt the only working SWR meter I and It would be cannilized in a heartneat. I am going to do the neon but if I come accross another small micrammeter I will have a meter. I can tune all units with it. Tx, amp and tuner and I can see the modulation on the meter. I have a sked this afternoon again between 2 and 2.30 with VE6PG . It is down in our zone on 7120 . I any want to evesdrop (or jump in if your a VE and can run AM fone down there.
Don VE3LYX

BTW the no 1 thing I noticed with the tuner (using the field strength meter)is there is a LOT LESS rf in the shack. Hopefully it is out on the Antenna where it can do some good.!

Hi Don,

RF power meters are usually made to operate at a specific impedance, usually 50 or 75 ohms. The impedance between the antenna and tuner could be anything - in fact, that is why you are using a tuner in the first place! There will be standing waves on the line as well, which could add to erroneous meter readings for some (cheapo) meter designs.

How did your sked go this afternoon - did you get to talk to Tim on 7120?

I wasn't available at 2:00, but tuned in around 2:50. Tim was still there talking to another VE3 named Al - I didn't write down or remember his callsign. I couldn't have joined you anyway, as our phone allocation only goes down to 7125 KHz. Would have liked to hear your rig, though.

That lamp, or something very close anyway (same voltage and base) was used in the Radiola 17 that graces my living room, so it's at least 1927 or close enough. (It's connected to the 71A 5V filament supply, so it'll last pretty much forever).

AWA Group friends-- I am working through a 1929 rig build with a friend. Couple questions for the group who may be familiar with the National Radio Institute Correspondence Course from the late 1920s which describes a Hartley transmitter.

Instead of 'straight cut' variable capacitors, will tapered cut work?
I don't have any straight cut on hand, but I could probably get some.
Question two: would a pair of output tubes in parallel (ie. push/pull) clean up the _tone_ of the transmitted signal?
What do you think?

Jim.

Instead of 'straight cut' variable capacitors, will tapered cut work?

Yes, but the tuning will be more touchy as the plates are near full mesh (which is where you want them for Hi-C oscillator). You get more capacitance change for a given amount of shaft rotation.

>

Steve Flood has already answered the condenser question.

As far as push-pull vs. single ended, I can't think of a way the TONE would be effected. Frequency stability can be improved with push-pull because the parasitic tube capacitances are now halved (they are effectively in series), and these are capacitances that change with the temperature of the tube elements. So I would think drift and possible chirp would be lower with push-pull, all else being equal. Also, even harmonics are canceled out in push-pull, so you don't have to worry so much about 2nd harmonic output.

Sunday was a perfect day. I spent about 4 hours at a local hamfest, talked and yaked with some good friends and resisted many temptations from some old boatanchors. I also picked up some antique tubes for the Hartley and Meissner from fellow AWA'er, Kirk Cline...now those rigs are more period correct. I also picked up a nice Superior Electric Voltbox...7.5A variac/meter and outlets...looks late 30/40ish. And a few more assorted odds and ends. I came home about mid-day and the wife had a great dinner ready. Later I went to Studio B and plugged in the new, old tubes and they all worked.

After dark I fired up the '24 Meissner and started CQing. Finally a stn in PA answered and we chatted for a bit...then more CQing. For a while it was just me and the fish-net beacons. I think it was just after 7PM when lo and behold I get an answer...its our esteemed VE3CUI. Eddy was pretty strong about 569/579 and he gave me about the same report...altho QSB was pretty deep at times. I was receiving on the RME-69, and xmiting on the 160m Windom. Eddy, you must have some pretty good ears on 160. I am now running a C-301A in the Meissner...200vdc at around 18ma...3.6 watts input. That QSO really put the icing on the cake for a perfect day..tnx Eddy!

Hi Bill,

You had a VERY nice signal, & readily copiable throughout our QSO---but the QSB was slowly taking its toll on you as you progressively got weaker & weaker with the band changing...

Irregardless, it was GREAT hearing you on 160! I wish MORE OT aficianados would take the plunge & try it out, too! You pretty much have that entire bottom 10-KHz of the band as your own personal pleasure palace...! Hi Hi

Nothing TOO exotic here in the receive dept., Bill: I heard you on one of my two K9AY receiving loops, aided & abetted by an old AMECO pre-selector. The transmitting antenna is a triangular 3-element phased array, & I was running my old Yaesu FT-980 barefoot, 100-watts all the way...

That 4-watts coming outta that little 301A is amazing---EXCELLENT keying characteristics, VERY steady! All the more reason for more to try Topband, I think...here's hoping that YOU'RE now addicted to the place! Hi Hi

> Sunday was a perfect day.

Sounds like a great day, Bill.

It was a pretty good day here too.

First thing I did was my most successful attempt yet at putting the Old Buzzard Rig (see http://ne1s.rfburn.org/Old_Buzzard.html) on 10M. I had wound a grid coil during the week for the PP-812 PA, as the commercially-produced ones I had would not quite go high enough in frequency. Saturday I touched-up the neutralization on the PA stage with the 10M coils in place. So yesterday I cranked the variac on the plate transformer way down to about 500V DC output from the power supply, and tried tuning up on 10M. It was very stable, no squirreliness or tendency for the PA to go into oscillation. But I couldn't fully load into either the 50 ohm dummy load or antenna - I think the antenna link on the PA plate tank needs more work. The link now has 1.5 turns (the way it's constructed it needs an odd number of half-turns), and the tank coil itself is only 4 turns of 1/4" copper tubing, plate-to-plate. Even with maximum coupling, and the link resonated with a series air variable, I could only load to about 140 mA at 1000V, and achieved about 80W output. This is less than 1/3 of what it should be capable of, and on the lower bands I get about 300W of carrier out. I didn't crank the plate voltage all the way up (about 1350VDC) because with the PA so lightly loaded I was getting some arcing on positive modulation peaks in the final deck above 1000VDC. So there is more work to do, but I'm making progress.

But since I was anxious to make a contact with the rig anyway, I ended up talking to two stations, one in England and another in Belgium. These were the first 10M contacts I've ever made with that transmitter.

I took a break from radio mid-day to bring inside and stack more of the season's firewood, and to go on a 10 mile tandem ride with XYL Elaine. Then at 3:00PM I checked into the New England PW AM net on 3875 KHz with the plate-modulated Hartley running 5 watts, and was copied 100% by all stations on frequency, including W1GIG in CT. At 4:00 I joined the AWA Sunday PM AM net with the PDM transmitter.

I probably do more radio operating Sunday than any other day of the week this time of year because of all the AM nets I enjoy checking into. (I know that's poor English but "into which I enjoy checking" just doesn't sound right :-)).

I couldnt reach him today. At one point during a handover he stopped and listened an said "I thought I heard someone in there" but that was as close as it got.
The tuner deffinatley improves the output but not huge Maybe 10%to 15 % . I guess I have to finish the PS and get some good voltage on the plates.

Sounds like everyone had a great day.(I didnt but cest la vie) I will have my screen modulated hartley down on 80 as soon as my new 365 cap comes for the tank circuit. i am thinking about a SERIOUS PA for it. maybe my 6v6 driving something "beeger". 807? 6L6? 813? No no 813 I dont have anything to power that. Something that would be happy with 5 to 7 hundred volts.
Did some antenna work now and have the SWR on 40M down to almost zip. fFred up the Cw hatley with the 45 today. 7110 area. So far no joy.

Tnx Eddy for the QSO and info on the signal. I am amazed at how stable it is. However, at the moment I'm cheating by using a Heathkit bench supply. Later, when and if I go period power supply, the tone and possibly the stability may change a bit. I have run it over an hour, CQing and/or in a QSO and the counter stays right on freq. The ole QSS (QSB) will surely take out my one or two watts into the ether. You have a very good station & expect you have done well award wise. I have been active & addicted to 160 since the late 1970s..never over 100 watts and only mediocre antennas. Still don't quite have the magic 100 on the band yet (did get WAS tho). The usual rig, during this vintage stage I'm in is a Viking 2, HQ170 and inv. L, with a 4 wire counterpoise. The Meissner uses a 160M Windom. I expect I'll be a little more active than usual now that the Meissner has made a few contacts and will be hanging around the bottom 15kc (except around 1AW). Oh, if you don't mind, I would appreciate a QSL for our momentous QSO. Let me know what is needed for sase postage.

Thanks for this, Larry. I reckon I've revealed my period _receiver_ theory familiarity, and transmitter theory _un_-familiarity. Thanks to my good friend VE3AWA, I have the bug! NRI published a Hartley circuit and layout that takes up about two feet! I think it would be improved by an extra tube....

And start studying for the Advanced License....

Got the tx rx tracking bang on today. Added 7 pfs to the rx side of the dual gang and bent on adjustment plate on the tx side and I got it. I had avoided this for awhile since I figured the last part would be hard. It wasnt.
The tuner is looking good with its new knob and painted front panel. It works good too. I decided to use a plug and connect my field strength meter to a gimmick cap made by windong an inch of wire around the cntre conducor wire coing off of the L switch. Since it is the very last leg of the tuner circuit it indicates power out and is very easy to tune with all the way back. The pot is an aid too if the meter gets too high on the scale I can scale it back to the middle. If I can find a small round microampmeter I will build one in but for now it is a nice good working set up.
I worked on my new PS today. I now have 700V and 351V Dc available. Since it will be choke input final recult will be 630V and 315V plus all the filment ac voltages 2.5, 5 and 6.3. I had everything in srock in my junk box.?! I wonder if my 6v6 can stand 630 volts. When my 6l6s arrive I know they will.
I am thinking of a rebuild of my Amp. It works good but I need more suds. Perhaps a two stage deal would be better. I will know once I get the new tube in a full voltage on it. Already planning the next AM rig. I think I am addicted!
I also spent an hour on my 40M antennas.

I recently acquired this well made variable capacitor. Can any one identify the manufacturer and the vintage 1920's? 1930's? It tunes very smoothly an there is a marking in pencil that says it is 280 PF. There are three mounting holes which enable a panel mounting and the shaft is quite long.

Hi Bill,

I'll fill-out a QSL for you here to-day, & drop it off at the village post office whenever I might have access to the family chariot---all I want for it is your card in return...

I think you'll like my QSL: it's a colour view of all of the keys that I have here, right from my first made in Japan plastic hand pump, to my Vibroplex Vibrokeyer (and several stops in between, all Vibroplex, of course!).

I started on 160 almost from the very beginning here (I got licensed in '71, got on the band in '73). My station way back when consisted of a Johnson Ranger-1, & a Hallicrafters S-77A. The antenna was a dipole for 80-meters, tuned to 1.8-MHz by way of my HB transmatch! To date I have 148 DXCC countries worked on the band---a far cry from most of the other diehards that one meets there...!

Larry, I sure enjoyed looking at your 'old buzzard' project. I expect it will really romp & stomp up on ten...esp. when you get it at full power. Will you be running it on the usual 10 mtr AM freq....I'll have to give a listen sometime when the band is open. I imagine some of the DX stns find your rig description a bit of a mystery..hi.

Congrats on a very nice job...73, Bill K4JYS

Tnx Eddy, for the QSL and I'm looking forward to seeing your keys.

You have done a very good job at the DXCC. Most of those other die- hards probably are running big pwr and super tx/rx antennas. A friend of mine, W4HHN, just popped over the 100 mark..we got on 160 about the same time. He has never run over 100 watts and I think all contacts were with a Drake C-line and slopers...he's a vry good DXer. Hope to see ya again on top band...73 de Bill K4JYS

From: Don
Topic: 4543 Message: 4543

I labeled the tuner and permanently installed the jack for the FS meter. At the last minute I realized drectly behind the jack was the top of the output variable capacitor. I had linked all three section together at the top and since it is electrically the same connection I looped the wire from the jack around those wires. It works fine.

Hi Bill,

The card is all filled-out & in its envelope, which I shall deliver over to the post office here in about an hour's time...

Let me know when you receive it, with thanks...

~73!~ de Eddy VE3CUI - VE3XZ

PS: Bill, are you anywhere near the Outer Banks of N.C.? We spent at least 3 very memorable summer vacations on Ocracoke Island there years ago. What a wonderful place for a mini IOTA DX-Pedition! I had a blast there on IOTA #067...

Subject: [AWA Group] 1929 dial lights

Oh, no! Can it be another dumb question? Yes, fellows, it would seem so.

Reading April 1929 QST at 2:30 A.M. (!?) I came across an idea I think I would like to incorporate into my power supply. It recommends using a six-volt dial light as a fuse to protect '81 rectifiers in the event of filter condenser failure [or other catastrophe, one presumes]. I find it an interesting idea. The article says the lamp will light to full brilliance at 150 to 200 milliamperes.

Can anyone educate me about six-volt vintage dial lights? Did a six-volt, ~150 milliampere dial light appropriate to the period have a type number? Or otherwise how would I know if I were looking at one? Am I likely ever to be looking at one? In other words, are they out there to be had? It is hoped such a beast would have a miniature screw base... since I've plenty of sockets for such.

Thanks & 73,
Paul N1BUG

Bill & Lou, your QSLs are finally in the mail. I sincerely apologize for the long delay.

As of 11:30 last night, aided by 6000 (yep six thousand) blistering watts of halogen work lights, my home is as winter-ready as it can be this year. Whew! I can come out of panic mode! A lesson about taking on too much well learned, too. This morning it's snowing & wind howling & big plows rumbling by every hour or so.

I just put the final coat of finish on the second part (shelf) of my new vintage gear desk and mounted my newly acquired vintage key on its little mahogany board. I need to get some non-skid feet under it though. I take brass pounding to a whole other level. Guess I'll have to go modern on those. I'm going to coast & relax for a couple days & then regroup and take stock of where I am on parts for winter projects.

Happy Thanksgiving to those in the U.S.!

73,
Paul N1BUG

I took one of my old transformerless supply and ripped it apart to make a new one. I am almost finished and tested it today (The Smoke Test) loading it in to a huge 11.2K power resistor and letting it run for about 15 minutes. Voltage at the high voltage section was 779V. There is also a 1/2 voltage outlet (from centre tap. I built the Econamy Power Supply from the 1983 handbook. It seemed like a good deal. I had everything except I dont have a 25K power resistor which I would like for a bleeder resistor. Nothing blew. No smoke and the choke stayed cool. In fact the only thing getting warm was the big power resistor. I may have to cobble up all the power resistors I have to make a decent bleeder. Anyway I make from the math that I can do 50 watts input with it for sure. I think my math is right.
779/11200=.06955A X 779V= 54.179Wtts

In fact the only thing getting warm was the big power resistor. I may have to cobble up all the power resistors I have to make a decent bleeder. Anyway I make from the math that I can do 50 watts input with it for sure. I think my math is right.

Tnx Paul..looking forward to your card and will get one back to you.

Wow, with all the light power, just keep 'em burning and you won't have to worry about any snow.

I also 'pound the brass' pretty hard here. When I use the Hartley I hve to put the key (which is on a piece of Masonite) in my lap, with a foam rubber cushion. During the event, I also put a thick piece under the Hartley and clamp the key to the chair arm. We have a AFB near by and when the jets rumble, so does the Hartley (& the TNT too). You might try some cork on your key board...that might keep it still and may even be vintage.

Sounds like you do need to take a break...esp. tomorrow after eating all the good food we all generally partake of. Likewise, I hope all have a great Thanksgiving (in the US of A)...I'm sure we all have a lot to be thankful for...other than our favorite hobby.

Psssssst.My dad the engineer who is a math whiz (graduated high school at 13 years old) goes nuts when I do math like I just did. He says he doesnt know why I always do basic math and never use algebra but always get the right answer. Anyway thanks for the tip. I will remember it as well.
BTW When he caught me figuring cylinder volumes with bore time bores X..7854 X height or stroke he went nuts. "Where did the .7854 come from?" he asked. I told him "because a circle is 78.54 % of the area of a square of the same dimensions." How do you know he asked? I replied" because I took a morning and sat down with a piece of paper and figured it out. I knew it was less that 80% but more than 75%." He still just shakes his head. I like to see the steps I guess.

Don,

Your math is fine but remember the 25K bleeder will use up some of that power. Assuming a constant 779V (in reality it will vary some depending on the load) the bleeder will consume 24 watts... using your method, 779/25000=.03116 X 779V = 24.273 watts.

So if your transmitter were running 50 watts input and you have a 25K bleeder you would actually be drawing 74 watts from the supply.

I often find myself doing math that way too even though I do know the shortcuts. Why go the short route? It just wouldn't be me...

73,
Paul

Bill,

I already have your card. I'm just very late replying to it.

Wish I'd thought of leaving those lights on to melt snow. I think I got a tan while working near 'em last night! Of course it is more light than really needed for any job but I found long ago more lights equals less moving 'em to avoid shadows where you want to see. Now I just go nuts and flood an area with light from multiple angles. :)

Thanks for the cork idea. I will see if I can find some.

It'll go there, Don. As a matter of fact that was the rig I was using when I was calling you on 7290 a few weeks back (and you weren't there because of confusion on the time).

But, at the moment, it's set up on 10M (talked to an HB9 this morning) and I'd like to leave it there for a while. I have a Viking I I can easily tune up on 40M, how does Friday or Saturday morning sound (right now I'm procrastination going out to shovel snow, and tomorrow we will be at my mothers place for Thanksgiving most of the day).

What values are those? Must be pretty high if they aren't even getting
warm. After all, creating heat is what a resistor does when it's working
:-)

Subject: [AWA Group] 1929 dial lights

Oh, no! Can it be another dumb question? Yes, fellows, it would seem so.

Reading April 1929 QST at 2:30 A.M. (!?) I came across an idea I think I would like to incorporate into my power supply. It recommends using a six-volt dial light as a fuse to protect '81 rectifiers in the event of filter condenser failure [or other catastrophe, one presumes]. I find it an interesting idea. The article says the lamp will light to full brilliance at 150 to 200 milliamperes.

Can anyone educate me about six-volt vintage dial lights? Did a six-volt, ~150 milliampere dial light appropriate to the period have a type number? Or otherwise how would I know if I were looking at one? Am I likely ever to be looking at one? In other words, are they out there to be had? It is hoped such a beast would have a miniature screw base... since I've plenty of sockets for such.

Thanks & 73,
Paul N1BUG

Hi Bill,

Most of this I can't address but did want to offer one comment for whatever it may be worth (probably about what you paid for it :)

I am power supply limited at 320V for the time being. With a UX-210 in my TNT, 320V and 10K grid leak, the tube would draw about 40 mA (13 watts input). I could get about 3 watts out before the note began to deteriorate, so less than 30% efficiency.

I found that by increasing the value of the grid leak, the tube would not draw as much current but the note was slightly better and efficiency went up. I was surprised since all the articles call for a 10 K g/l. After repeating the tests many times and much head scratching, I decided 50K is the "sweet spot" for this rig with a pre-1930 RCA UX-210. At 320V, it will only draw 20 mA (6.4 watts input) but as I said the note is a bit better and I can get 3+ watts out before the note starts to suffer. That's close to 50% efficiency, which also surprised me. Obviously the tube runs a lot cooler which is probably a good thing.

As I recall the biggest change occurred somewhere in the range from 10 to 20K ohms, but continued to improve slowly up to around 50K. Above 60K available output was starting to drop. Somewhere around 80 to 90K the thing got squirrelly and oscillation didn't always start cleanly. I did try going below 10K and found it to be a disaster with the note.

I believe Lou has made experiments along these lines also so perhaps he will chime in. I'm still very surprised at the results. By the way I repeated all my tests with two different UX-210s and got nearly identical results with both of them. There's something of luck and black magic with these rigs, I think. Your results may vary. :)

I am power supply limited at 320V for the time being. Paul is multi-talented!

Yes, that has been my experience as well. Bill, suggest that you replace ur GL with a 50K pot than play with the value. A very helpful approach.

450 B+ is not too high for a 210. At that voltage, and with the ant link coil at abt 25 degrees relative to the tank plus 700 pfd. in series, I get 8+ watts output on 80.

Happy Thanksgiving.... Lou

Hi Lou,

I have been running a '10 (non balloon) with good results...but you know how it is..we gotta keep up with the BUGs. The tube is a National Union NX 10 H...a great big balloon type, bigger than other 210s and looks real good. I think it could probably be considered a 1929 tube, since NU was incorporated in Sept 1929. When I built the Hartley, I went by the articles and never diddled with the GL R or C values. It just went to working with no problem, so hooked up the antenna and let 'er rip. I'll be testing the NU 210 on 80 & 40 over the next few weeks, before the BK event. I also picked up a couple of C-301As, which will be period correct for the '24 Meissner.

Tnx, Lou & Paul for your info. I can't remember the exact B+ but am running around 40-45ma on the plate. The '10 liked that ok so will see how the 210 works. It will be easy enough to play with the GL so I'll try the pot. Oh, also gotta tame the Hartley down a bit to the ten watt limit.

Now gonna QRT for the ole turkey. All you Thanksgiving celebraters have a great day...73, Bill K4JYS

Whenever I experimented with power oscillators in the past, yes the efficiency can increase as does the linearity. I watched the output of a single Cossor power triode Hartley oscillator on a borrowed 1GHz Spectrum analyzer as I toyed with grid leak values (both C and R) just to see what would happen.

What I found is that if you optimize the gridleak for one frequency, the oscillator may halt at a lower or higher frequency. My best guess is that a 10k grid leak resistor is meant to guarantee the oscillator will always startup and keep running.

Another thing I measured was the effect of gridleak capacitance against a fixed 15k leak resistor. I found that the lower the capacitance value, the greater purity came forth in the oscillator. But stability during startup could suffer. I was able to get the oscillator to run on 80m with as little as 8pF gridleak capacitance and as high as 47k gridleak resistance in series with a 1mH choke and the second harmonic measured -40dB below the fundamental.

A higher gridleak capacitance is used to make the oscillator be able to give a lot more output but at the expense of linearity.

Think of the Cathode-Grid circuit as a valve diode. Then connect it to an oscillating LC circuit with a gridleak combination R-C circuit.
Effectively you've got a half-wave rectifier being fed by the LC oscillation circuit.

It seems the current draught on the half-wave induces more second harmonic distortion in the LC circuit when the draught is excessive, and this will occur when you have a gridleak composed of a relatively high value of "C" and a lower value of "R", guaranteed to keep grid current high and power output strong.

At least this is what I measured, it was about 3 or 4 years ago. :)

Paul,
I think what you are experiencing is the change of grid bias by changing the grid leak resistor value.
With the lower value grid leak, the grid is more positive and operating closer to class A or A/B mode.
Linear but not efficient.

With the larger grid leak resistor the grid cap takes longer to discharge thus keeping the grid more
negative and operating closer to class C mode, which is more efficient. Class C works great for CW.

A larger grid leak puts the tube way beyond cut off I think with the result of distortion and loss of power.

From my understanding of how the bias works I think this is what you are experiencing. If I'm
wrong I'm sure someone will correct me. :^)

Hi Bill,

Most of this I can't address but did want to offer one comment for whatever it may be worth (probably about what you paid for it :)

I am power supply limited at 320V for the time being. With a UX-210 in my TNT, 320V and 10K grid leak, the tube would draw about 40 mA (13 watts input). I could get about 3 watts out before the note began to deteriorate, so less than 30% efficiency.

I found that by increasing the value of the grid leak, the tube would not draw as much current but the note was slightly better and efficiency went up. I was surprised since all the articles call for a 10 K g/l. After repeating the tests many times and much head scratching, I decided 50K is the "sweet spot" for this rig with a pre-1930 RCA UX-210. At 320V, it will only draw 20 mA (6.4 watts input) but as I said the note is a bit better and I can get 3+ watts out before the note starts to suffer. That's close to 50% efficiency, which also surprised me. Obviously the tube runs a lot cooler which is probably a good thing.

As I recall the biggest change occurred somewhere in the range from 10 to 20K ohms, but continued to improve slowly up to around 50K. Above 60K available output was starting to drop. Somewhere around 80 to 90K the thing got squirrelly and oscillation didn't always

start cleanly. I did try going below 10K and found it to be a disaster with the note.

I believe Lou has made experiments along these lines also so perhaps he will chime in. I'm still very surprised at the results. By the way I repeated all my tests with two different UX-210s and got nearly identical results with both of them. There's something of luck and black magic with these rigs, I think. I finished the PS today.I found enuf power resistors to make up a super duty 26K bleeder. I built sides and a back on it so I couldnt accidently touch it. If I had had the wood to fit it would have got a top too. I tried the low hi-voltage section on the power amp. Little if any difference from what i had. I checked the voltage under load. It was almost the same as before, just sligtly lower. SO i tried it on the mid high votage section. 400 volts. My old 6v6 was not happy there and essentiallly the amp would not operate. Luckily it was ok when back on its normal power.

AWAGroup friends--I have two lifetimes of resistors and capacitors that are common to servicing commercial 1920s through 1960s radios. I would be pleased to make them available to the members at a very reasonable cost. Not a lot of electrolytics, though. Unfortunately, for power resistors, I only have max 10k/10w. I use these guys a lot: http://www.tubesandmore.com/ but they don't list a 120k/10w resistor; could be an odd value. I also have close to me Orion Electronics in Kitchener which is one of the last places in all of Kitchener-Waterloo/London that still serves the service industry.

I would be pleased to assist any members. Mind you, service would be a mite slow....

Jim.

I saved both the links given us today. Thanks both of you who gave them. Meanwhile my workaroud turned out better than expected. Voltages under load are where I think they should be and the Bleeder is a very heavy duty unit. I am wondering where to hook up my hartley CW rig with its 45. I have run it on 280V but wonder it it can stand 4 or 500 volts, 700?
meanwhile i am thinking of a redisin on my amp. I need more gain than is available I think. I think a two stage may be required.

Thanks John,

That all sounds reasonable to me.

I'm still "getting up to speed" on triodes and bias developed across a resistor. I have to stop and THINK every time about whether bias is getting more positive or more negative with a change in the grid resistor. :) Virtually all of my experience with tubes (mostly RF power amplifies in the 300 to 1500 watt class) has been with tetrodes using a separate bias supply.

The discussion on 210 tube specs prompted me to ask this question. I seem to recall (vaguely!) seeing an article on this somewhere but can't seem to locate it again. Maybe I imagined it.

What factors besides power supply ripple affect the note quality (buzz, hum, growl) on these self excited oscillators?

My plate supply for all tests so far has been a "modern" precision regulated lab/bench supply which should have near zero ripple. I always have some buzz/growl with the TNT. The 71A tube is worst, UX-210 is better, and 01A has the least amount of growl. I'm wondering if there is anything I could do to reduce it. Changing the grid leak resistor does affect it, but only slightly. It's not really a problem, it's just that I like to understand things and this I don't.

Hi Steve,

Thanks for the comments. While operating I did have the key and tx on the same table. But my tone tests were done with a very short clip lead across the key binding posts on the TNT and hands off everything.

With the 01A and 71A tubes I used a HP 6181C DC current source (0-100V 0-250 mA) for filament. When I tested the UX-210 with DC on the filament I used a homebrew 0-15V 5A supply. Both look excellent on a scope with no load or a resistive load, but the presences of RF is an unknown factor. In all tests so far I used a HP 6209B DC power supply (0-320V 0-.1A) for the plate. That plate supply did show signs of distress during my second QSO with Lou, in the form of voltage sag with keying. I'm certain that was due to RF getting into the power supply!

You don't even want to know where I stole 7.5 VAC when I tested the UX-210 with AC on the filament! There was nearly 200 pounds of iron involved!

Soon I will be doing some tests with a completely different power supply arrangement, no finicky solid state voltage regulators involved.

It is interesting to note that even if you can monitor a hum in shack it doesnt hurt to check it from a distance. My 50L6 80M gives a bit but is managable. Since it is a transformerless supply with a doubler I figure it isnt too bad. The Am Rig I can hear the hum in shack when monitoring but up the road hear none. Three wire Ac cables are on big source I have found. A lot comes in through the house wiring. too.Regen detectors are very good at hearing hum. I think that the world has yet to see a quiet 60cycle Ac power power supply.

Topic: 4598 Message: 4598

A few days ago it occurred to me I could probably use my Heathkit PS-23 power supply with the TNT. It is rated 12.6VAC 5.5A for the filament, so I put the supply on a variac and adjusted it for 7.5VAC at the UX-210 socket. That gave about 480VDC on the plate. Just for grins I stuck a 3 ohm rheostat in the filament circuit. By juggling that and the variac I got the plate voltage to 550VDC no load.

With my 50K grid leak, it will load to 35 mA with the voltage under load being 525VDC. Near as I can tell with my power meter (which I don't entirely trust) it will make about 9 watts out.

Then I discovered something interesting and a bit unexpected. At this plate voltage, the affect of antenna coupling on the note is much more pronounced than at the lower voltage I had been running! I can get close to a T9 note now by reducing coupling! My best guess at power output in that case is 6 watts.

The tube seems comfortable at this voltage. There is no visible evidence of gas (glow) and no strange behavior. I didn't test very long due to concerns about the 1920s 3 ohm rheostat in the filament circuit. I'm not sure if it can sustain 1.25A long term or not. It gets pretty warm.

Next on my experiments list is an attempt to check the accuracy of my two RF milliamp meters at DC or 60 Hz.

Are you thinking of the QST article about signal quality, in preparation for 1929? If so, I know of it, and read it a few times, although I can't cite you a reference for a moment. I believe the author was either Grammer or Hull.

```
> What factors besides power supply ripple affect the note
> quality (buzz, hum, growl) on these self excited

One possible cause is RF getting back into the power supply and creating mixing products with the 60 Hz AC there. Chokes in the power and filament leads may help, as well as bypassing. Oh, and bypassing the anode to cathode for RF on each rectifier diode (which is preferably of the hollow-state variety) may help as well, if this is the source.

I have also heard somewhere having the oscillator filament and HV windings on the same core is asking for trouble; separate transformers are better.

As well, Paul. Are you using a 75-100 ohm C.T. resister across the filament? If so, check if it is in fact really balanced. My new built TNT had a ruff sig. I double checked all significant components except the Pilot fil. resister, and all were OK. Finally, replaced the Pilot with another and...BINGO!... sig was fine.

Are you thinking of the QST article about signal quality, in preparation for 1929? If so, I know of it, and read it a few times, although I can't cite you a reference for a moment. I believe the author was either Grammer or Hull.

> What factors besides power supply ripple affect the note
> quality (buzz, hum, growl) on these self excited
> oscillators?
>

One possible cause is RF getting back into the power supply and creating mixing products with the 60 Hz AC there. Chokes in the power and filament leads may help, as well as bypassing. Oh, and bypassing the anode to cathode for RF on each rectifier diode (which is preferably of the hollow-state variety) may help as well, if this is the source.

I have also heard somewhere having the oscillator filament and HV windings on the same core is asking for trouble; separate transformers are better.

Are you thinking of the QST article about signal quality, in preparation
for 1929?
Possibly, but I can't be certain. I vaguely recall reading something that talked about tuning, power supply, and oscillator circuit factors which could affect the note. But all of the above may not have been in the same article.

One possible cause is RF getting back into the power supply and creating
mixing products with the 60 Hz AC there
My afternoon experiments lead me to believe this may have been the case.

Are you using a 75-100 ohm C.T. resister across the filament? If so, check if it is in fact really balanced.

Good point Lou. I'm using a pair of 100 ohm DeJur resistors which I hand picked for best match. IIRC one read 95.6 ohms, the other 95.7 - best I could do out of a lot of 10 resistors.

Mike,

Yes they both have internal thermocouples. The Weston 425 thermocouple is a bridge - RF in one end of the bridge and out the other, meter connected across the center of the bridge. The Jewell 64 has a different type. The thermocouple is two sections of wire in series, RF flows through both; meter is connected across one of them. Both meters behave well and as expected with RF, I just can't verify accuracy.

Don,

I understand about using bulbs. I know it is good advice you are giving. I know that is how many did it in the 1920s and it is a great relative indicator. The truth is I'm not adapting well to this part of the hobby. I love building the old rigs! I love hunting parts! (though it's frustrating occasionally) But I have character flaws or whatever you want to call them. I insist on understanding how and why things work, and being able to quantify how well they work. It is really bugging me that I can't measure the output of this rig. I keep trying to let it go but it comes back and bugs me again and again.

I finally realized (at 2:00 this morning, right out of a sound sleep) I do have a way of generating exactly 10 watts of RF power and knowing that it really is very close to 10 watts. Duh! That is within the range of the 500 milliamp RF meter, so at least I can check that one now.

I insist on understanding how and why things work.
I would hardly call that a flaw. It has been a problem for me as well. Sometimes accepted explainations dont make sense and occasionally they are just poplular, not correct. I am just totaly frustraed with my rf power meters. All of them When i have doubts I check with a light bulb. It never lies. Takes money to buy whiskey. Takes power to light an incandesant bulb. But now you have given me a great idea. If I put a meter accross my incandesant bulb I will have the best of both worlds. A po'boys thermocouple. So then if I see 16 watts on the meter and no light on the bulb I can say to the meter with confidence "You LIE!"

Hi guys, Just a reminder that the rules and logsheets are up on the AWA website at: http://www.antiquewireless.org/hamevents2010.htm

Inspite of the 2010 numbers in the link, it's for the 2011 events.

This morning I'm mailing off about 60 reminder/rules/ logsheets to hams that I don't think are on either the AWAGROUP or Rons Antique Wireless Association reflector. Contest Manager Tim Walker W1GIG suggested that we don't need to do this anymore since most everything is on the internet. He's right so t his will probably be the last year of the large mailing but I do know of several hams who don't do computers or internet so I may continue mailing to them . I did not mail logs to you foks that post on the reflector because I know you are aware of the event and have access to the log sheets.

I usually get the mailings out in early November but things have been busy . The shack was completely packed away as we remodeled the walkout basement including shack. The remodeling is nearly complete and I have a desk placed in the shack where I'll be wiring up the 29 station this weekend. L ast month m y wife was in a serious car accident after being rear ended by a fast moving semi while she was stopped on the freeway in traffic. She's safe and getting over cracked ribs. Car was totaled when the trunk ended up in the back seat and they had to cut her out of the car. And then work has been super busy this Fall and if you can believe the irony , another large layoff has been announced for the week of December 12, so that is gnawing on me lately. Maybe I should become a wealthy retired gentleman like Eddy and Lou, and not have to worry about this layoff stuff :)

I've found the packed away 29 Colpitts and power supply and plan to wire it this weekend. I'm looking forward to hearing and hopefully working all you guys next weekend!

Paul -

I do not understand what is going on. Are you sure you were only putting in a few milliamps? How did you limit the current? Can you try again reversing the polarity and see which way the needle goes. Use less current if need be. Thermocouples do not have a direct connection between input and output. Right now from your explanation, it is a dilemma for me. 73 - Mike

Well that is how I ID. Victor Echo Three Lima Yankee Uniform. Anyway I have been alone there all week and today when it counts it is overcrowded. The unsteady carrier is when I tune up my Tx tank circuit in, the final is hand sensitive and may give a "wowow" as I sneek it in place.or correct it for antenna load. When I sub the big cap there with a smaller one I may put a ceramic coupler in and move it back in the chassis an inch or so. the osc is rock stable. Too bad the final tank cicuit wasnt. I put the standby rx on SSb to find the low point on freq. Anyway I will give it a shot later after lunch. And if your not in shack so be it. Thanks for the time today anyway.

Mike,

I am certain the current was less than 1 milliampere DC. I will try again later with better current limiting (to a few microamps).

I found a Google books result that discusses r.f. thermocouple meters. The Jewell appears to be what it calls a "mutual type thermocouple". The Weston appears to be what it calls a "bridge type thermocouple". The URL is very long and may not post correctly but I will try:

(http://books.google.com/books?id=mxVRJRYCi-QC&pg=SA2-PA63&lpg=SA2-PA63&dq=shunt+rf+ammeter&source=bl&ots=PXuTDKH5Zf&sig=USPrzWi5LnAnoHAaNwjgkHqY3uE&hl=en&ei=YA7RTs3WOuXi0QGArpg8&sa=X&oi=book_result&ct=result&resnum=4&ved=0CDUQ6AEwAw)

73,
Paul

I do not understand what is going on. Are you sure you were only putting in a few milliamps? How did you limit the current? Can you try again reversing the polarity and see which way the needle goes. Use less current if need be. Thermocouples do not have a direct connection between input and output. Right now from your explanation, it is a dilemma for me. 73 - Mike

Subject: Re: [AWA Group] RF milliammeter testing

Mike,

Yes they both have internal thermocouples. The Weston 425 thermocouple is a bridge - RF in one end of the bridge and out the other, meter connected across the center of the bridge. The Jewell 64 has a different type. The thermocouple is two sections of wire in series, RF flows through both; meter is connected across one of them. Both meters behave well and as expected with RF, I just can't verify accuracy.

73,
Paul

It sounds to me that these are simply low current DC meters that were meant to be used with external thermocouples. Have you taken the case off of either one to verify they have a thermocouple in them? 73 - Mike

Subject: [AWA Group] RF milliammeter testing

I will shut up for today after this... I promise!

I just thought for what it's worth I would share my experience attempting to verify the relative accuracy of two RF milliammeters.

One thing I am very sure of at this point. Neither the 500 mA Weston 425 nor the 100 mA Jewell 64 RF milliamperes meter likes direct current! Even a mere milliampere or two sends the needle bouncing off the peg on either of them! Scary!

If I were to accept that the meters respond similarly at 60 cycles and at a few Mc., then one is reading about 15% low, the other 30% low. However I notice both meters trying to "follow" the peaks and nulls at 60 cycles. The pointer appears fuzzy and 2 to 3 times its normal width! I am not entirely comfortable that 60 cycles is a viable means of checking calibration, though I do see it widely recommended.

I have a 100 MHz oscilloscope at my disposal, however I am reasonably certain it cannot be trusted in the presence of a few watts of RF energy.

I feel like I'm chasing my tail on this one and that the only way to check that these meters are even in the ball park would be to compare against an RF power meter of known accuracy. I do not have access to such a critter for these low power levels.

73,
Paul

Hi Paul,

If you check into the AWA website, there's a link to past articles in THE OTB - THE AWA JOURNAL---look for the re-print of the George Grammar piece re. signal quality from the 1930's...

It is probably THE definitive piece on the signal quality of self-excited rigs, & is MUST READING for any & all 1929 QSO Party aficiandos, IMHO...

Hi Paul,

Many thanks for the info on your 210 setup and testing. I need to do some adjusting here and find the sweet spot. However, my first run on the air sounded pretty good...as good as the '10. We have had some real good discussions of late re. the 210, note quality and the rf meter. I'm trying to absorb all the good info. I picked up a Weston mod. 425 rf ma meter, last weekend at a local fest. It is f/s at 120ma and came with an instru. sheet. I'm interested in your findings. Haven't tried it yet...may be too low a value for the rigs here (wishful thinking I guess) but I'm gonna give it a try.

Oh, I got your QSL and many thanks. I look forward to another QSO with our '20s rigs...73, Bill K4JYS

Subject: Re: [AWA Group] 210 Specs.

Hi Bill,

Most of this I can't address but did want to offer one comment for whatever it may be worth (probably about what you paid for it :)

I am power supply limited at 320V for the time being. With a UX-210 in my TNT, 320V and 10K grid leak, the tube would draw about 40 mA (13 watts input). I could get about 3 watts out before the note began to deteriorate, so less than 30% efficiency.

I found that by increasing the value of the grid leak, the tube would not draw as much current but the note was slightly better and efficiency went up. I was surprised since all the articles call for a 10 K g/l. After repeating the tests many times and much head scratching, I decided 50K is the "sweet spot" for this rig with a pre-1930 RCA UX-210. At 320V, it will only draw 20 mA (6.4 watts input) but as I said the note is a bit better and I can get 3+ watts out before the note starts to suffer. That's close to 50% efficiency, which also surprised me. Obviously the tube runs a lot cooler which is probably a good thing.

As I recall the biggest change occurred somewhere in the range from 10 to 20K ohms, but continued to improve slowly up to around 50K. Above 60K available output was starting to drop. Somewhere around 80 to 90K the thing got squirrelly and oscillation didn't always start cleanly. I did try going below 10K and found it to be a disaster with the note.

I believe Lou has made experiments along these lines also so perhaps he will chime in. I'm still very surprised at the results. By the way I repeated all my tests with two different UX-210s and got nearly identical results with both of them. There's something of luck and black magic with these rigs, I think. Your results may vary. :)

OK, - You can count on my being there! 9:30AM EST tomorrow on 7141.

Check out the Old Buzzard Rig on my web page - I've got it up on 10M, around 29.0 MHz, and have been having a blast. The antenna (Cushcraft A3 at 32') has some trap issues, which I need to address, so things aren't optimal. But I've still had no problem talking to people all over Europe. Just before dark today I was in a round table with couple of guys, one in Louisiana and the other in Mississippi.

Got two cats now, both males (see attached).

Thanks Steve for the nice comments. It's been a labor of love and I look forward to each QSO Party! It's so much fun working all the 29'ers and hear the variety of transmitters and sounds out there. From all the chatter on here it sounds like there will be a bunch of TNT's on this year.

Tonight I put the 29 push pull 210 Colpitts together with the Collins 75A-4. The shack is still all boxed up and stored in the back room. Literally I'm having to dig through shelves and boxes to find this stuff. I never did find my nice soldering iron and fresh roll of solder tonight but I did find an old iron and enough solder to get the PL-259 on the 80m coax. Took a while to find the cw key and enough wire to connect the power supply. I have the Colpitts purring on 80m with a signal that sounds pretty good.

I'm hoping 40m is more useful this year now that we've moved it up above 7100 Kc.

Never a better time to break-in the new shack Scott! I hope 40 will be easier this year as well. As I recall, you have a ripping signal on both bands...
I still need to deploy my 8 ground radials for the quarter-wave wire verticals on 80 and 40 and get the TNT ready. I'll have the Hull Hartley on 80 / 160 and may just use it on 40 as well. I discovered last year that the darn thing works pretty well on 40m without changing coils...it's just not so high-C once I tune it down to 40m but the note still sounds pretty good and the output is as it should be....it is however, a lot harder to zero beat a frequency using the big coil.

See you next weekend.

Hi Bill,

I will be doing some more testing on the RF meters today and report back.

I know it is possible to add a shunt to some of these meters to extend the range... just as you would with a DC instrument. I have a 100 mA Jewell meter I'm going to try shunting to get 500 mA f.s. It will require a shunt on the order of 0.6 ohm. The trick as I see it is to get a shunt that has low inductance and capacitance. I have some ideas. I probably won't get to the shunt experiments today though.

73,
Paul

On 11/26/2011 11:50 AM, Bill Stewart wrote:

Hi Paul,

Many thanks for the info on your 210 setup and testing. I need to do some adjusting here and find the sweet spot. However, my first run on the air sounded pretty good...as good as the '10. We have had some real good discussions of late re. the 210, note quality and the rf meter. I'm trying to absorb all the good info. I picked up a Weston mod. 425 rf ma meter, last weekend at a local fest. It is f/s at 120ma and came with an instru. sheet. I'm interested in your findings. Haven't tried it yet...may be too low a value for the rigs here (wishful thinking I guess) but I'm gonna give it a try.

Oh, I got your QSL and many thanks. I look forward to another QSO with our '20s rigs...73, Bill K4JYS

The 71A tube is worst, UX-210 is better, and 01A has the least amount of growl. I'm wondering if there is anything I could do to reduce it. Changing the grid leak resistor does affect it, but only slightly. It's not really a problem, it's just that I like to understand things and this I don't.

Hi Scott er al,

My thanks to you, as always, for the great job you're continuing to do with the Bruce Kelley affair...

This year, for something a little different, I hope to use my 3x227 MOPA transmitter. In order to cure its frequency "squirreliness" I've taken to replacing the fixed components in the oscillator tank circuitry. Hopefully it'll settle-down & behave itself again, like it did when I first used it some years ago...

I think for a receiver I'll give my ol' Heathkit SB-301 a work-out this time around: it's been awhile since that rascal has seen any on-the-air action, & I really do like its tight 250-Hz Fox-Tango IF filter...

The freezing rain that we had here earlier this week took down one half of my 160-meter twin-lead fed doublet, but I've since repaired it...I plan on using it as an extended dipole for 80- and 40-meters (it worked great for me last year).

Looking forward to some good, "private" 40-meter action up above 7100-KHz, too! That was a good move on your part, Scott...

Don't forget Ross Hull's August 1928 QST article, "Overhauling the Transmitter for 1929". It is a great article for anyone interested in putting a late 20s/early 30s self excited oscillator on the air. This includes the Hartley, Colpitts, TPTG and TNT transmitters used in the BK. In the words of QST editorial that month, this "is, we feel, one of the most important articles ever published for the radio amateur. Let every amateur study it most carefully, and apply its information, for it contains salvation for 1929."

Along with design details for Hull's Hartley, lot's of interesting experimental data is presented that backs up the claims made about how to tune the '29 transmitter.

The pleasure was all mine, Jim. Good to talk with you, finally.

Sorry you were having such problems receiving me. You may have had better results running a receiver with an AM detector, such as the NC101X in your Email address (do you have one?). I could have switched to SSB, but that would have meant coming upstairs to a different shack location and re-tuning a different antenna from 75M to 40M. It would have taken about 5 minutes or less.

For low-power AM you could plate-modulate your 1929 rig fairly easily, once you complete it.

Too bad we didn't hear anything from Don. He said he was going to be there. Maybe he was, and the low power just didn't cut the mustard this morning.

You are absolutely correct, Larry, I have an NC101X but it awaits restoration. However, I have a Hallicrafters SX25 not two steps away, plugged in on my service bench, which is fully restored and works very well. Chalk it up to my inexperience. I'll move it this afternoon! And get to work on the National....

> So what are you making now Steve?

Well, it's still a bit of an experiment...My present goal is to get at least 1 watt of 10m output using a single tube Tri-tet oscillator with a 7mc xtal...modelled after the one shown in the '38 Handbook. I'm starting with a 6L6 and once I've run some tests with it I would like to try a nice ceramic-base RK39 (similar to the 807) and see if that will work. Handbooks indicate that 2nd harmonic power on 20m can be as much as 15W so I'm hoping to find at least 1 watt on 10m...anything else would be a bonus. I have no idea how good / bad the keying might be but that's all part of the fun...build and see. I've been having so much fun lately on 10m CW (mostly 28037 with my 7009 xtal) using the recently built 'Longfeller' that I'm thinking the 'Tri-tet-Ten' might actually be something that would be do-able. I had forgotten how good 10m can become when solar flux numbers get high enough!

Hi Bill...you are correct. Topband does not officially come into play until next year but a few of us have been building 160m tanks for our heaps and plan to try to work each other on the second weekend. Scott has indicated that any 160 contacts will be mentioned as a point of discussion and hopefully encouragement for next year's operations. I have the Hull Hartley ready to go and in fact, my first test 'CQ' on topband was answered by no other than N1BUG! Transcons are do-able on 160 but it does require more than a longwire and a pipe in the ground.

I heard you both and tried (when I could find a split second opening:>)) This afternoon finshed my inbetweeen stage for the PA. When i first hokedit up te meter went almost top of the scale . It was a 25% before underfull modulation. ThePa was self oscltng . Too many clip on connecting wires so i reroutedthem and got zip. the Amp doesnt want to work with either extra voltage or the extra drive. It could be the 6V6s just dont want to work that hard. I sorted through my6v6s One was a bummer but two work exacrtly the same in the pa so I am thinking they are most likely good. I measure voltages on the Pa prestage or preamp of you will. They are not signifcantly different than the Pa itself. 227 V under load. 6 volts accross cathode resistor. Nothing showing on the meter when measuring accross the grid resistor. Plate voltage and screen are within a few volts screen being lower. I know the Pa isnt working because it doesnt tune right or any when the pre amp or the high voltage is applied. As unlikely as it seems I think the 6v6 is laying down on the job and going beyond its abilty to operate. I am not sure though. (never built one of these before) I had reasoned that since the signal coming from the rig is clean and sounds good and since the Pa boosts it some that adding a untuned stage between not unlike early Mopas used should bring theRF?AF up to a decent level to drive the PA tuube but it appears the PA tube doesnt like being pushed. Jims 6L6s are not here yet but when they come I will try them at least in the PA final. Screen resistor is 6.8K. Cathode 400 ohms with a .047 cap in parallel, I have a 001 in the grid imput and a 500 ohm grid resistor, I am stealing plate voltage from the PA Olate RFC on the good side. ??????

Yes I did a lot of ten in the final six months of my amatuer license before I got my Advanced.
I havea rock bound rig here, a 50L6 it was when I built it but it is now a 50C6 which is a much better tube . it puts out a fair chunk of power. I have it on 80 but thought of putting the 40M tank in it and doubling . I already have the 40 tank made, just never tried it.I also used it with my variable freq crystal. I have worked NC with it and Lou as well. It doesnt lack power just oppourtunity to use it. Sounds like you are into a fun project. Let us know when it is ready to perform. I will record it on the twinlex regen.

Paul, I did some quick testing with the Weston 425 this afternoon. No indication from the Meissner @ 4w input. I do get about 70ma reading from the Hartley @ 15+ watts input. I think the only thing this will be good for is a tuning indicator. I don't have any confidence that it will tell me how much current the antenna is taking and no correlation to power out..maybe comparison only. But I think I'll put it in place of the lamp for that setup..love to see the meters kick..hi. I got no indication at all using a 2 turn coil to the meter. Oh, I have the instru. sheet for that meter if it would be helpful....73, Bill

Don,

Forget trying to build an untuned amplifier stage at HF with tubes. It's very difficult to do because the parasitic tube capacitances present too much of a load to the signal - they need to be "sucked up" into a resonant circuit. There were some specialized tricks used to get a wideband video amp for analog TV - but it's easier just to use a tuned stage for your application.

4683. More on RF milliammeter testing

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-11-28 00:25:08 UTC
From: N1BUG
Topic: 4683 Message: 4683

I finally got back to it. I can only conclude I did something stupid or had some test equipment malfunction during earlier tests. I was very cautious and triple checked every bit of data gathered today. I even completely un-wired the test setup and re-wired it between tests and was only satisfied after getting identical results 3 out of 3 times. :-)

Weston 425 500 milliampere RF meter:

88.5 mA DC results in full scale reading.
Meter deflection does reverse with polarity.

588 milliamperes 60 cycle AC results in full scale reading.
Pointer jitter makes it appear 3x normal width & fuzzy.
The meter reads 15% low on 60 cycle AC.

10 watts RF in a perfect 50 ohms system reads 380 mA.
That is 15% low. That holds for 1.8, 3.5, 7, 10, & 14 Mc. Above that the error increases.

It appears 60 cycle AC can be used to check calibration of this meter, though I do have some concerns about possibly harming the meter. This particular meter has a 15% error.

The thermocouple is a bridge, RF in one end and out the other. The meter is connected across the center of the bridge.

Jewell pattern 64 100 milliampere RF meter:

1.79 mA DC = f.s.
Meter deflection reverses with polarity.

196 mA 60 cycle AC = f.s.
Jitter causes pointer to appear ~5x normal width & VERY fuzzy.
Meter reads 49% low on 60 cycle AC.

No tests performed at RF since I have no means of measuring RF at such low levels.

The thermocouple is two sections in series, input to output, with the meter movement connected across ONE of them (one half of the thermocouple).

Pure conjecture on my part:

Evidently the meter movement is presumed to ignore the presence of RF and respond only to the DC potential developed across the thermocouple due to heating. The mechanical meter movement would be too slow to show "jitter" at RF and/or the coil in the meter movement is an effective choke and no RF flows through it.

With 60 cycle AC I do not know how much current is actually flowing through the meter movement, but I suspect some is and that is the source of the "jitter". I doubt the thermocouple could respond so quickly as to produce this effect.

It may be that meters for higher power levels have a separate heater & thermocouple to avoid connecting the meter directly to a circuit carrying RF. I don't know and don't plan to buy one to find out.

That's all I can tell ya, folks.

Hi Eddy and all, Thanks for the nice comments.

What? No Rollins Rocket this year. OMG. :) It sure was a treat to work you with the "Rocket" as it had such a unique yodel to it. I'm looking forward to working you with the ur MOPA this year. Unless I get my 3x27 MOPA running, I"ll be using the push-pull 210 Colpitts again only because I didn't have time to get the MOPA running this Fall.

Ok on your 301 with 250 hz filter. Thanks for the reminder. This summer I was given a Ten Tec Corsair with a 250 hz filter and it is a treat to use on CW. Here I hooked up the 75A-4 to use in the 29 QSO Party but I should use the Corsair. Man I need that 250 hz filter to separate the signals. The 75A-4 500 Hz cw filter seems to do more ringing than filtering. I hate listening with that filter.

On moving the band up above 7100, all I did was implement what several folks on here like Steve and Lou and others were recommending. I think it'll be a dandy chance for us to actually hear each other without all the RTTY, digital, nets, high power mess.

I'm looking forward to working you guys next weekend!

I have been working with my amp package. I am now getting several times the power on the ant tuner meter (X5 of what it was) but my amp is making Rf all the time. It could be because I have it all jury rigged with 8 inch clip wires. I did have it working though showing modulation and such but it shouldnt be putting RF out when the tx isnt on. I willl recheck everything in the morning and clean it up with short connections. When I get it workingright I will rebuild the amp package in the new chassis completley. I am hoping it is just the excessive wiring causing the problem. The tank tunes for sure now . I swapped tubes to get it working. Had a bummer in the preamp. Still not convinced I have it right . Stole the circuit from the 1940 Handbook. VFO 10 to 15 watter under low to meduim power transmitters. I basically built the last two sections of that circuit and and used my Tx and modulator unit to drive it all. I think it should work. If you see a flaw in my thinking I can use the guidance.

Hi Bill,

I would be interested in seeing that instruction sheet for the 425 meter. Can you scan & email it?

I'm guessing you put the meter in the antenna feeder? Bear in mind you would have to know the impedance at the specific point in the line where you insert such a meter to measure power with it. I suspect the impedance varies widely along a line feeding a Windom. In that case all you could expect from it is a relative indication. If you had, say, 2 watts at a 50 ohm point, that would be 0.2 amp. I=SQRT(P/R). If the impedance were 500 ohms, it would be 0.063 amp, and so on. My antennas are all coax fed with very low SWR, hence my attempt to measure power with one of the darn things, hi.

Morning Paul,
Don't have a scanner, but photo copies went in the mail this morning. Hope the info is helpful.

Yes, I put the meter just a few feet away from the xmtr, in the single wire feed line to the Windom. You are right about the meter location. I really don't know where it should be hooked, to show something of value. There should be nodes and peaks along the feed line and finding the sweet spot is a lot of work. I'll keep it as is for a while and use for a tuning indicator and tune for max current. According to QST and HB info, if the antenna is a half wave long and the feed line is hooked to the proper spot, the SWR will be minimum. (The ant. construction info was graphed out plus formulars were available). If I understand it correctly, that point should be the 500-600 ohm imped. point. The feed line could be most any length...one experiment used a 1200 ft feed line...with only wire resistance losses...73 Bill

A friend of mine, Steve WA1QIX is an absolutely brilliant engineer. Seriously, one of the smartest people I have ever met. Everything he designs/builds sounds excellent on the air (truly Hi-Fi AM). But he rarely goes beyond the prototype stage - everthing is held together with clip leads and chewing gum (just kidding about the chewing gum). In other words, butt-ugly, but works well.

I rebuilt the preamp in my new modular style. I have them daisy chained together but they work. I have another no good 6v6 . That may surprise you but before you speak I should say these are tubes I removed when I repaired the leslie amp on our church's Hammond organ. I had 4 and so far have only one that is good. I am sad they dont work but happy I was right in my diagnosis. I put in a matched quad set to replace them. I have had them for a few years and dug through just in case there was a goody. I tried swapping ends .(Since Ant tuner is a pi it works fine as a final tuned circuit too. Pre amp as amp and pa as preamp since theya re not that different. Depended what tube I had in the last one as to power out. I tried variable grid bias (the LV trick) I was however already at the sweet spot so I will pull the adjuster out and save it for another experiment. It sure is a handy way to see what works best.
Still working on 7141.

I rebuilt it all today. New chassis, (same tree) I finally got too tired to continue and I cant see where my bypass capas are. I have three to add in the morning. Hookup the final tube's grid and solder the tank coil wires. Then who knows. If it workssand it should since it is a stolen design with no "Donisms" it is supposed to be capable of 10 to 15 watts when link coupled to a low level Hartley VFO. Since it is NOT a class C amp it should handle the carrier and modulation and never know the difference. We shall see. I should now have CW mod as well with this deal. But I know not every good idea works out.

Morning Bill,

Thanks for sending the copy of the meter instruction sheet. Much appreciated. I owe you one.

I understand the theory on the impedance where the line and antenna connect. It has been years since I read theory on the Windom and I don't recall what the feeder impedance is considered to be. Maybe 500-600 ohms? Maybe that is why they chose the tap point. I would have to think the impedance of a single wire would vary tremendously depending on its surroundings... but what do I know? Very little, on that subject. Anyway you've got a nice meter for a relative indication and tuning aid. I'm looking forward to using my meter in an antenna coupler when I find the right variable condenser. I have stepped up my search but nothing has surfaced yet.

Hi Guys,

I'm working on my 1929 3x227 MOPA rig for use this time 'round, & planning to give the Rollins Rocket a bit of a break...

I'm in the process of replacing the fixed resistors & silver mica capacitors in the tank of the MOPA, to (hopefully) cure the frequency instability that it displayed on its last outing.

The antenna will be a 160-meter inverted "V" at 50' (which I recently had to repair on account of freezing rain) fed with twin lead, & I expect that my venerable ol' Heathkit SB-301 will do the honours on receive.

The only issue that I can foresee at this time will be the conflicting schedule the first weekend with the ARRL 160-meter contest---but the good thing is that when Topband goes to sleep, 40-meters should be jumpin' & jivin'---and the plan to utilize the old U.S. Novice frequencies of 7100- to 7150-KHz this year is a really good one.

So listen for my "special" call of VX3XZ in the next two weekends! I'll most certainly be on the look-out for yours...!

Good luck in the spree, & my vy

From: Bauman, John
Topic: 4698 Message: 4698

Last week I dug out my PSK-80 Warbler xcvr I built 7-8 years ago. Connected it to an aged laptop computer with an old version of Digipan. I'm up and running PSK on 80 mtrs.

"So what does this have to do with antique radios" you're probably asking? Stay tuned for the "Rest of the Story".

After making a couple contacts every night with the Warbler, last Saturday or Sunday, I ran across a strong station up on Whidbey Island in Puget Sound, Jim KC7TY. We chatted along for quite a while and I told him I was familiar with Whidbey Island because my brother was stationed at Oak Harbor NAS back in the early '80s and I used to ride my motorcycle up to visit him. Jim tells me that's about when he retired to the Island in 1982. I found this statment curious.

And now for the "Rest of the Story":

Last night I had another QSO with KC7TY. We talked about our Thanksgiving, who we had over and what we ate too much of. Jim went on to tell me about all the emergency services he's involved in with the local radio club and hospital. I mentioned to Jim I was involved in building and operating antique style radios. That's when Jim dropped the bomb on me... He said he's 94 years old! He was first licensed in 1936 with a W6 call. His first rig was a TPTG using a #47 osc driving a pair of #46s, his receiver was a regen! During the war his licensed lapsed, he retested after the war.

Now I've only been an Amateur Radio Operator for 20 years but this was my first on air contact with a real Old Timer. Now how cool is that?! I hope to have more QSOs with Jim, I'd like to ask him questions about operating those early sets. The set up of his first TX and RX, how he mentored his sending and what he used for T/R switch over or did he use two antennas. He's pretty sharp and his memory seems clear, this will be much better then reading an old QST or Handbook.

Anyway, thought you'd all like to hear about this. I'm sure some of you guys have had similar experiences.

John

Subject: [AWA Group] An interesting QSO

Last week I dug out my PSK-80 Warbler xcvr I built 7-8 years ago. Connected it to an aged laptop computer with an old version of Digipan. I'm up and running PSK on 80 mtrs.

"So what does this have to do with antique radios" you're probably asking? Stay tuned for the "Rest of the Story".

After making a couple contacts every night with the Warbler, last Saturday or Sunday, I ran across a strong station up on Whidbey Island in Puget Sound, Jim KC7TY. We chatted along for quite a while and I told him I was familiar with Whidbey Island because my brother was stationed at Oak Harbor NAS back in the early '80s and I used to ride my motorcycle up to visit him. Jim tells me that's about when he retired to the Island in 1982. I found this statment curious.

And now for the "Rest of the Story":

Last night I had another QSO with KC7TY. We talked about our Thanksgiving, who we had over and what we ate too much of. Jim went on to tell me about all the emergency services he's involved in with the local radio club and hospital. I mentioned to Jim I was involved in building and operating antique style radios. That's when Jim dropped the bomb on me... He said he's 94 years old! He was first licensed in 1936 with a W6 call. His first rig was a TPTG using a #47 osc driving a pair of #46s, his receiver was a regen! During the war his licensed lapsed, he retested after the war.

Now I've only been an Amateur Radio Operator for 20 years but this was my first on air contact with a real Old Timer. Now how cool is that?! I hope to have more QSOs with Jim, I'd like to ask him questions about operating those early sets. The set up of his first TX and RX, how he mentored his sending and what he used for T/R switch over or did he use two antennas. He's pretty sharp and his memory seems clear, this will be much better then reading an old QST or Handbook.

Anyway, thought you'd all like to hear about this. I'm sure some of you guys have had similar experiences.

John

Paul - for my first BK two winters ago, I sent my vintage style '7SL' card to all 36 stations worked. If I recall I had an almost 100% return. In last year's party, I sent cards just to the new ones that were worked. Yes...by all means...please QSL!!

Yes alot of the 29'er send out QSL cards. It's your option. While I didn't send any last year, in the previous years I've sent my "9WFA" card although I don't see it hanging on VE7SL's webpage so I better get on the ball and send one to Steve this year.

Quite a few guys print up special cards on their printer with either pictures of their equipment, of themselves using it, or cards that duplicate the look and feel of the 20's no-prefix style.

The QSL's are fun to hang on the shack wall!

I found my tubes today. Thanks Jim. They were gathering dust at our local post office. (All our route's mail one day last week was misdelivered (New Guy) so the PO notice never arrived here and whoever got it was too lazy to drop it off or call. (I live in a community of 150 people so we all know each other at least superficially.)SO of course I went to work and I now have it cooking. 22 times the power on my tuners meter (I counted the meter divisions.) The power supply I am using wants to lay down Voltage under load falls with the 6l6 and a 6v6. but it still does a decent job. I will give it a whirl on air tomorrow. I also now have CW abilty since the design featured keying the PA (Tail end of a rig on 1940 Radio Handbook but had to be changed slightly). Part way through the afternoon when things were going backwards In desperation I turned on the Kenwood and gave a couple of "QUACKS". That seemed to clear things up. This amp does not park(yet) I may have to raise the grid resistor . Seems to me back in the day when I had a Viewstar Amp (Hammond) it didnt park either (No one seemed to worry about that.)and I rigged a foot switch to act as a press to talk deal. Come to think of it that switch and cable is right here in the other cabinet in my shack. I saw it last weekend. Anyway thanks Jim. We now have more soup.

Yes, indeed.

One of our regular Gray Hair Net (8:00PM EST Tuesdays on 1945 KHz) members is Sam Beverage, W1MGP, who has been licensed since the 1930s, is in his nineties, and used to work for National and Millen (I believe his boss at Millen was James Millen himself). Sam checked into the net last night, as a matter of fact.

> Don VE3LYX

Hi Don,

You'll never quite reach cutoff with cathode bias, as current must be drawn to provide the bias voltage. But, you can reduce the idle current to a safe level, which should be your goal. Maybe temporarily clip-lead in a pot to dial it in, and then measure the resistance and replace it with a fixed resistor.

What are your plate and screen voltages?

I have about 12 unique sets of coils for my FB-7, 10 of which are in a rack to hold them. I also really like the FB-7, but, found it somewhat difficult at times if not used with a pre-selector, as images were at times louder than the intended signals. I used a Peak pre-selector with mine, and, that made a world of difference.

I do not believe I ever got a number. When I used to check in, Seymour (W2JBI) used to be the NCS most of the time, who lived in Little Silver, NJ, not too far from me. Unfortunately, he became an SK about 10 years ago. He was really a great guy. 73 - Mike

Hi Guys,

I think I resolved my instability issues with the 3x227 MOPA here: I replaced a couple of the fixed silver micas in the oscillator tank, as well as a resistor---seems OK now...

I still want to clean the tube socket contact points, i.e. where the 227 pins meet the metal: usually I simply dip the base of the tubes into some isopropyl rubbing alcohol, & insert / pull-out the tubes several times. Seems to do the trick for me.

The signal remains rather chirpy, despite it being a MOPA. Still, it's my hope that I will have at least stymied any propensity for "...wind wobbulation" by virtue of that extra stage betwixt the antenna & the oscillator!

The Heathkit SB-301has been aligned, & is good to go, too...

About the only big thing that I can foresee invading my operating time will be the ARRL 160-meter contest, which starts Friday evening. I guess that'll leave 40-meters pretty much wide open, come Sunday morning, for the BK...and of course, there's always that second weekend just 7 days away!

Still wanna optimize & log the ideal control settings for the transmitter working into a 52-ohm load, as well as pre-tune the 160-meter dipole on 80- and 40-meters, & record the settings of the transmatch...most likely a task for the morrow!

Yes, the images are definitely a problem. But, I love the FB-7 for what it is. For most of the operating or listening I do, it's not been an issue, because there are usually not strong signals removed 2X the IF frequency from where I usually hang out

Yes, I remember Seymour well, he was the "president" of the net until he died. Before Seymour the president/NCS was John, W2NXB on Long Island. Seymour took over when John passed away. Now the president is George W1AJW (used to be W2UAX), and NCS duties are shared between 4 or 5 stations.

rr Larry - I know in the past, my best results for 40m have been just after your sunrise when everyone seems to vacate 80m...good condx for Transcon at that time as it is still an all darkness path.

Well I will start out on 40m then and be keeping an ear out for you...probably at 7.110 +/- ...if I don't see much activity I will switch to 80m after 30 minutes and by the time I get everything switched over and retuned, the midwest should be workable from here on 80.

Hi Guys,

I did some more work on the 3x227 MOPA this morning...

Because there is no loading control on the finals as such (as there is in a modern pi-network output circuit), one has to vary the coupling betwixt the output antenna link coil & the final amplifier tank coil in order to achieve some modicum of control over how much the final plate current the 227s will draw. In "...ye olden golden daze" this was achieved by way a "swinging link" coil, or a tapped link coil...

Unfortunately I incorporated neither such feature in my rig when I built it way back when...so instead, to-day, I added a variable capacitor between the link coil & ground, thus enabling me to control coupling to the tank "...electronically". I got the idea from a transmatch that I built here eons ago, based upon the circuit in the first edition of UNDERSTANDING AMATEUR RADIO.

I still have to test it here to confirm its effectiveness (and there IS an observable difference in loading / plate current between a light bulb dummy load, & a 52-ohm non-reactive one, in any "fixed" set-up like I had before).

It dawned on me, too, that you guys have never seen the 3x227 MOPA---so included herewith are three pix of it for your "...dining & dancing pleasure", Hi Hi

Hi Pete,

I've scanned the schematic diagram for the 227 rig for you---hopefully it'll come through A-OK...please bear with me as I am NOT used to this Apple iMac system here!!!

Credit for the design all goes to Don Metzger, who provided the info to my friend Tom (VE3HN), who in turn passed a copy onto me.

The only changes that I made from the original are (1) I used TWO 227s in the final (in parallel) for a bit more "horse power" instead of just the single tube, (2) I halved the 10K grid resistor in final PA as a consequence of this fact, and, (3) I made coils for all of the low bands, i.e. 160-, 80-, and 40-meters.

Also, despite my incorporation of the voltage regulator tube (below decks, of course!), the rig still has a propensity to chirp, especially on 40-meters...but then that's what imparts flavour into these "time machines" of ours, and merely adds to the fun & excitement of our forays back in time! Hi Hi

Please let me know that you were able to see the schematic alright, with my thanks in advance...

~73~ de Eddy VE3CUI - VE3XZ

Hi Again Pete,

If you REALLY get ambitious, here's Don's matching regenerative receiver, utilizing---what else?!---two more 227 tubes!

Hi Guys,

If anyone has a hankering to burn-in their new OT rig / coils / killer antenna for Topband, this is the night to do it!

The QRP ARCI is hosting its annual 160-meter QRP contest tonight, from 7:00 PM until 1:00 AM (6 hours). The recommended operating frequency is around 1810-KHz. You send RST-State-Power Output, & receive back (if members of ARCI) RST-State-ARCI Membership Number. Fof further details, go to:

http://www.qrparci.org/content/view/5267/118/

A good chance to see how effective that low power 1929 transmitter of yours might be for any future AWA sponsored Topband events on 1.8-MHz...!

Hi Larry,

There's always a hawk-eye in the bunch, isn't there...?! : >)

Admittedly, they did NOT have the regulator tube type VR-150 back in the day---but they DID have at least one type of gaseous regulator, which---as far as I know---is classic "unobtanium" to-day...

So, while it isn't 100% "...kosher 1929" in the hardware department, it is, at least just that in spirit! Hi Hi.

Doesn't help much anyway, Larry---the rascal STILL like to chirp, which is just FB by me...

A good way to determine what components were available when is to look at old magazines which feature construction articles.
Of course there is QST but Radio Broadcast provides better info on parts used.
http://www.vacuumtubeera.net/RadioBroadcastMagazine.html
Unfortunately, during at least the 1927-29 period, Faradon did not show their products in their ads nor were their parts much used in the construction articles. The Faradon filter capacitors used in my MOPA were about the only parts in the transmitter that I could not confirm were available in 1928 (other than one beehive and some power resistors which I know are newer).

Are you referring to the 874? He 874 was an early one, but I don't know if
it was around in 1929 or not. Around 90V, IIRC. Got a few of those (spares
for the RAL and RAK).

> So, while it isn't 100% "...kosher 1929" in the hardware department, it

Probably RF from the final getting picked up by the osc. Straight-through
designs (no frequency multiplication) need good shielding between the LC
MO and the PA.

Thanks Jon! I'd stumbled across a few of those while beating Google to death but hadn't found the index. Looks like I'll be burning the midnight oil digging through those tonight!

I actually wouldn't mind early 30s condensers, if I can find them. I'm willing to compromise somewhat on the power supply in the interest of getting it built in this lifetime. ;-)

A few more 20's condenser tips:

Look for large rectangular sheet metal boxes-this sort of condenser is almost sure to be from the 20's. I know my Faradons are from the 20's, I just don't know if they were available in 1928.

Brands to look for include Tobe, Dubilier, Acme Parvolt, Potter, Igrad, Dongan, and Pilot - avoid types that were not sold to home constructors such as unlabeled pulls from broadcast receivers.

Filter condensers suitable for transmitter power supplies will be huge. Here is a picture of something I built using three 2-MFD 1000v condensers. Their combined volume is greater than the power transformer and dual chokes put together (although this often won't be the case). https://lh3.googleusercontent.com/-DBzcpE51pJs/Tbnb9IMlq9I/AAAAAAAAAV0/ljkdYBjPnPI/s512/IMG_4147.JPG
Here is an example of lower voltage units (voltage not marked) which are smaller but unsuitable for power supply use. https://lh6.googleusercontent.com/-efp1ontu1zs/TtgVEGIxKiI/AAAAAAAAAl8/zmSXrrEgTo8/s640/DSCN0991.JPG

Oh! Now I'm drooling! That is a beautiful power supply. Those are exactly the sort of parts I've been looking for. Very nice Tobe condensers. That's a Thordarson R-210 Power Compact, is it not? I have my eye on one, but NO info and I really don't understand them fully. Do you have any documentation on it, or specifications? I only "sort of" have an idea what is inside.

I have a stack of Pilot 9651 condensers (1 mfd 650vdc) which are long defunct. I'm going to see if I can find a way to extract the innards and stuff a modern cap in there, but a bigger problem is the labels may be too far gone to scan and re-create. I will stay on the hunt for better parts!

Don,

Since you have an interest in simple receiver-transmitter sets, you might find the article beginning on page 29 of May 1923 Radio Broadcast interesting. I'm not sure what quality of signal this thing generates, but perhaps you'll find something of interest in it.

http://www.vacuumtubeera.net/RadioBroadcast-Vol-03-1923-05.pdf

(Looks like I'm going to need a lot more than one night to look through all those issues. :)

The Thordarson R210 Power Compact is not very suitable for a transmitter since it uses a half-have rectifier so voltage regulation is none too good. It was available 1927-1929, I believe. It contains a 550 volt 65ma winding, two 7.5 volt windings (one connected to the hv winding for the rectifier), and two 30 henry chokes. It was intended for audio use so I used it in that 4.5 watt audio amplifier.

I have a spare transmitter power transformer but it is too old (1923ish) for a 1929 set. https://lh4.googleusercontent.com/-HR6OxITharw/Ttg0xTxGjhI/AAAAAAAAAmE/SF8oJRDtFj0/s720/DSCN0992.JPG

If you email me good photographs of the Pilot labels I may be able to reconstruct them.

Paul,
Yes it intrests me greatly. I have downloaded it 3 times but my computer locks when I try to view it. Too big a file for this piece of crap cpmputer (8.20 MB)All I wanted was a schematic. I have the parts sitting waitng for the build. Any four pin triode I figure. The rx in my hb Am transceiver works beautifully both ways. Just a matter of raising plate voltage from regen threshold to past squeal. O keep wondering why I built two osc circuit when one would do just fine. I will keep trying but if anyone could grab me just the schematic it would be enuf. Meanwhile here at the ranch the amp is working and we are testing on the hour when in the shack on 7141. Thanks for the heads up Paul.

Hi Don,

I WAS hoping to have it on the air above 7100-KHz during the BK on Sunday, & then on both 80 & 40 the following weekend...

But the XYL threw a big curve into my plans last night: seems her nephew & his family will be passing through the area two days hence, for some time...dinner & a lengthy chat will be the order of the day, I'm afraid!

Still, I really & truly do wanna sneak in some operating time then, despite the set back...

Oh, OK, I thought it was just me! Most of the time I've been using a Powerbook G4, a 2004-vintage Mac I inherited from my son Alex when he upgraded about a year ago. I got the file, saw the article and schematic, but, like you say Paul, patience was the order of the day! I suspect the hard drive is being used as virtual RAM. My Windows XP box (also old) does better, probably has more RAM.

Nope, not just you Larry. I've always found displaying
PDF files to be a particularly CPU-intensive process.
It varies with such factors as operating system and
PDF reader appliation, but they are power hogs. :-)
Not complaining, mind you! I'm enjoying looking through
those issues of Radio Broadcast and gaining a few more
bits of knowledge - particularly in the area of 1920s
parts identification.

From: Leonard Meek
Topic: 4757 Message: 4757

I just got this virus warning and thought it may be worth forwarding to the group:

You should be alert during the next few days. Do not open any message with an attachment entitled POSTCARD FROM HALLMARK, regardless who sent it to you. It is a virus which opens A POSTCARD IMAGE, which 'burns' the whole hard disc C of your computer.

This virus will be received from someone who has your e-mail address in his/her contact list. This is the reason why you need to send this e-mail to all your contacts. It is better to receive this message 25 times than to receive the virus and open it.

If you receive a mail called' POSTCARD,' even though sent to you by a friend, do not open it! Shut down your computer immediately. This is the worst virus announced by CNN.

It has been classified by Microsoft as the most destructive virus ever. This virus was discovered by McAfee yesterday, and there is no repair yet for this kind of virus. This virus simply destroys the Zero Sector of the Hard Disc, where the vital information is kept.

It's a hoax. The "virus" is that you send this message to all your
contacts.

Always best to check at Snopes before forwarding anything:

There was a Snopes check at the end but I neglected to copy it. But even then, how reliable is that?

Leonard

This is what I had planned to try. This osc circuit works well as a regen and becomes a pretty strong osc when you pull the Plate voltage up past regen area. I figured bypassing the regen control pot with the key would do it. I have used it with regen control turned up for a Grid dipper. If you just bring it into osc you can hear thechange in sound distinctly as you tune the tuned circuit in question by. After building my antenna tuner which is performing just wonderful I am thinking I like pi output circuits a lot .
Another way to do this would be to make a mopa and just use the osc to supply the Rf and amplify the signal. I am trying an alnighter tonite to se if I can get a quiet moment on 7141. I am running out of steam already though. ZZZZ
Oh yeah I started putting clothes on my amp. ThE RX TX is built inside a 1920 radio cabinet so i am trying to make the amp match more or less.

I am hoping to. I have everything. Even the batteries. I was playing with my single triode regen tonite. Works nicely . I was testing to see if it would transmit when regen was set too high. It doesnt however the hartley based Rx TX does it really well. Despite the fact it has a RF preamp in the ant circuit.

The way they go from Tx to rx is mearly by switching plate voltage from 22 minus the phones to 180 no phones. it doesnt matter I think which dircuit you use for an osc /regen. Since i am no longer tickled with tickler coils (whooo woow woo everytime t you go near.) I think I will use my favourite hartley circuit. I hope yu will all forgive me but I am using my 56 tube. I am about done with direct heated filments. The battery deal i8 already have except I have only 134 volts fully chaged instead of 180. The battery at H doesnt need to be hd. I can get 6 months out of 9 volts clipped together with no trouble. Of course the G needs to me stout if you want to get out. I shall start today.

I forgot the grid leak deal!
Here it is now.
If you can make a recvr transmit then you should be able to make a transmitter recve SO in that vein I will be adding and outboard 100K pot a 100K resistor and a set of fones and a bypass switch (fones or full B+)to the B plus circuit of my hartley. I know from experience I will need battey power on the heater if I expect decent perfomance. Ihave gathered it all in one spot and when time permts i will try it. I also figured out why my one regen will transmit and the other does. The one that does is on 161 volts B+ supply. The one that doesnt is on 67 volts battery supply for B+So I will try it at 134 tonite if I have time.
Don VE3LYX
Or this deal. I know the phones will work in the cathode circuit because i already have tried that before. It sees the same load since it is a circuit. Rx parts are in red. I was sure thatsomeone must have done it before because the regen circuit and the transmitter circuit are so similar. Thank you Paul for confirming it and finding that schematic for me. Being older and human i may have omitted a part.
BTW I love regens but I guess you can tell that.

Indeed! Last night I had my customary cup of hot chocolate with a shot of coffee brandy in it while working the test.

Nice hooking up with you on 40M last night, Steve. Also VE7SL (the OTHER Steve) on both 40M last nite and 80M this morning. What a treat, even better than Paddy Flaherty's or hot chocolate with coffee brandy!

What a great time! I've been hearing and working quite a few guys on 80m last night and a couple this morning. I'm not on 40m yet as I'm having antenna and equipment problems. Next weekend for sure but possibly this afternoon.

Band conditions were good, line noise low, signals long. I worked several guys from the New England states including our buddy Ed Gable at W2AN. He was running modern and I didn't count the contact but enjoyed the QSO.

I heard Larry NE1S but I had trouble pulling him out of the noise. Larry, I'm hoping to work you this year but signals were pretty low from Maine. Also heard WU2D and a couple others from up that way that I couldn't work either.

For some really long haul, I was pleased to work Steve VE7SL way out in BC and KK7UV in Montana. Also managed to work Lou VA3AWA but haven't heard our buddy Eddy VX3XZ. He's doing the 160m contest this weekend I know.

My 1928 Colpitts, a pair of 210's in push pull, has been working fb on 80m. Seems to sound ok, a little jumpy at times. Maybe someone on here will comment on it's 1928 tone.

The Midwest guys have turned out in force. I've worked maybe 12 Midwest guys on 80m.

I'm emailing with our buddy Don N9OO who is getting over the flu so he has been laying low. I'm surprised not to hear N9HAL from Wisconsin. It is rare not to hear him.

73, Scott WA9WFA

Hi Scott,

Well, no real joy in Muddville here, I can tell you...

First the good news: I made 460 QSOs in the ARRL 160-meter fray...now the bad: I attempted to call CQ AWA for a brief spell on 80 last night, & heard few signals. This morning I tried to get on 40 briefly, heard a very strong W2LD (I believe), answered him repeatedly, & got nothing back. But man was my rig ever chirping!

Have to make ready now for the 2:00 arrival of my XYL's nephew & family.

I think I'll do some work on the 3x227 MOPA over the week trying to extract more RF out of it, & trying different taps on the oscillator coil to (hopefully) improve its signal.

From the sounds of things, everyone had a good time. Oh well, just that much more for me to enjoy (hopefully) a week hence...!

I know...I know....just a little QSO Party fun ;-) In all seriousness, I am often surprised how spotlighty the prop can get, even on 80m. This is the type of thing I am used to seeing on 6m...like, one signal fom Maine and nobody else to be heard. Condx were, in a word, pretty bad ...OK, two words. Unfortunately, with the solar cycle ramping up, it may be this way for a couple of years. Last night we were being buffeted by two coronal hole streams and the absorption was very obvious at my latitude. Hopefully the sun will be a bit quieter next weekend but I doubt it, as there is a very large active sunspot grouping just swinging into geoeffective positioning for the weekend. The last two BK winters were just too good to last!

I suspect it is for primary taps. But the plate does say PRI 150 V. Odd. It's a pretty transformer though.

Or more likely it is for selecting different secondary voltages...

Robert has it.

These are made for 1 to 4 - UV-202s. To maintain fil. voltage as you add tubes/I draw, you adjust contact arm to increase sec. output...or sumpin like that.

73, Lou

P.s., SL, it has a c.t. for he-mam keying.

4812. Comments Following End of First Weekend of Kelly 1929 QSO Party

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-05 04:04:37 UTC
From: whitebear1122@comcast.net
Topic: 4754 Message: 4812

I hope everyone had a fabulous time operating in the first weekend of the Bruce Kelly 1929 QSO Party, I sure did!!

I heard there was a group of 29'ers operating 40m at the start of the QSO Party. I was having trouble with 40m so I started out on 80m. I heard alot of guys and worked a bunch. The East Coast guys were a tough copy for me although I did manage to work several. The 'furthest east guy' Larry NE1S from Maine was heard here in MN but I just wasn't able to pull him out of the noise. Larry, you were S minus 5. hi hi I did make a non point QSO by contacting our buddy Ed Gable at the headquarters W2AN station.

I was pleased to work several West Coasters including Steve VE7SL in British Columbia, and KK7UV in Montana, and Jim W8KGI in New Mexico. I didn't hear any other West Coasters so I know there are a couple of missing that I look forward to working like K5RB and our California friends.

Canada was heard and worked including Lou VA3AWA and Steve VE7SL. I didn't hear my buddy Eddy VE3CUI/VX3XZ. Eddy, you gotta dump that 160m contest stuff and kick the company out of the house so you can get on the 1929 QSO Party. hi hi Next year were adding 160m to the event just so we can work you in the 160m contest. hi hi

Several big guns missing like N9HAL, N9OO (recuperating from the FLU), and WA3FFC (recuperating from an injured wrist).

I heard and worked a couple of new stations like WA8DOP from Michigan and W9TFC from WI. It's always particularly fun to work new stations.

40m worked out fine as far as I could tell. 40m was open this morning after 80m petered out. I worked a whole lot more 40m stations this year now that we're up in the 7105 to 7115 portion of the band. Kudo's to you guys for coming up with this idea. It was sweet getting away from all that digita, nets,l and high power clutter down on 7040.

Signal quality was probably as good as I've ever heard, maybe a little too good. I didn't hear any downright crappy sounding signals at all. I can think of the worst sounding signal I heard and I ain't naming names, and still it wasn't that bad. hi hi

It was hard to even find some good "chowpee chowpit" sounding signals. I always smile when I hear those. Eddy, you got to get the 'yodeller' on the air year. And those of you that worked me on 40m, sorry for my drifting up in frequency 1 Kc during the QSO. My 28 Colpitts push-pull pair of 210's continually drifted on 40m. I'm not sure that push-pull arrangement is all that great. I think the push-pull circuit is more squirrelly than a single tuber so I'[d like to show up next year with a single tuber Colpitts.

I'll be on next Saturday night ready to work all you guys that I missed this weekend.

Thanks for a great time. 73, Scott WA9WFA in Saint Paul MN

Hi Scott et al,

I may well just get the ol' 2x203A Colpitts re-activated for the next weekend if I can't get anywhere with the MOPA...

That latter rascal is REALLY vexing me...any advantage that a 2-stage rig might present in the matter of reduced chirp seems to be completely & utterly LOST on that fellow! It sounded really, REALLY bad on 40-meters. Probably worse than the self-excited Colpitts!

So, Scott, the "Yodeller" may well make a comeback this coming Saturday..

...As for giving up on Topband...? NEVER! As Charlton Heston would have been wont to say, had he been a radio Amateur, "They'll have to pry the 160-meter bandswitch setting out of my cold, dead hands!" Hi Hi.

Glad everyone had fun this weekend---I only hope you've all saved some for me, 5 days hence!

~73~ de Eddy VE3CUI - VE3XZ

Hi guys,

I know it's along shot, but I finally got my parts organized and figured out what's missing. There is a long winter coming and I am lacking one or two parts for every project on my list. Time to get SERIOUS! So I'm pulling out all the stops and and looking under every stone one more time. That's in addition to beating eBay to death! :) I figure there might be a few more folks around at BK time, so here's my wish list, again, and more complete this time...

WANTED, will pay cash or trade if I have anything you need:

Cardwell type B variable condenser, .001 (43 plate), .0015, or .0017 (71 plate), must have black HR insulators

1920s transmitting filter condensers, 1 uf or more, 800V & up, defunct is OK if they can be re-stuffed and externally refurbished

Also looking for lower voltage filter condensers for an rx B eliminator, same deal regarding condition

Thordarson R-196 choke

Jewell pattern 54 panel meter with 1000 volt DC scale

2 matched UX4 tube sockets, NOT springy type, for '81s in a power supply. I like square ones with top posts but I'll settle for something else, probably...

Sangamo .0005 (500 pf) mica condenser, the flat-sided oval type. I could also use a set or two of G/L clips for Sangamo mica condensers if anybody's got a surplus of 'em.

Pilot midget variable condenser, like this one except as few plates as possible

TNX & 73,
Paul

From: Don Dulmage
Topic: 4615 Message: 4818

I finished the main work on the RF amp cabinet. The tx rx is built in a old somewhat worsted 1920s radio cabinet so I thought the amp should match. I am no cabinet maker but I am stoked at how it turned out. I still have the dial and labeling to install but it looks period correct. Key is plugged in because I can key the PA final to produce cw if I turn carrier power above modulation balance. I use an electromechanical carbon mic circui to produce the modulation . Normally I get 6 to 15 volts ac when modulaing from the audio transformer. Today I gathered a bunch of audio transformers liberated from old 30s and 40s radios. I hooked a pair up in series both pri and sec and tested it.not that great BUT I discovered on audio transformer I had removed from a old radio with an electromechancal speaker (as opposed to permanent magnet) It had a note on top saying 320 ohms. Normally 168 is normal. So I tested them all. 171 to 312 ohms with this one being the 312 ohms. When I had powered it up I got 34 to 40 volts AC instead of the usual 6 to 15 volts ac. If I can get 40 volts then I can run also the equivalent on the screen and the total will aproach more the original tube specs. This should I think raise power from the tx's final allowing me to drive the power amp harder. Sooner or later I will have this thing cooking. Must be the old electromagnet speakers used a different ratio audio transformer. .I beleive this one is from the Grimes Batteryless which my 56 tubes came from.

Hi Don,

I looked at the 1940 ARRL Handbook and don't see anything close to your description. Is the circuit you are referring to in the 1940 "West Coast" (Frank Jones) Handbook? If so, I'm SOL, as I have a 1936 1937, and 1942, but not 1940. I would like to take a look at that circuit and write-up.

I think you mentioned elsewhere the original circuit used 6AG7 tubes? If so, maybe the year is wrong, because I'm pretty sure the 6AG7 wasn't yet available in 1940. The 6AG7 is a great RF tube - very low Cgp due to a dense screen grid (much lower/denser than tubes like the 6V6, 6L6, 807, or TV sweep tubes). Plate dissipation is 9W, a bit lower than the 6V6 at 12W and a lot lower than the 6L6 at 25W.

I have a few 6AG7s that are surplus to my needs. There's a bit of surface rust on them, but they're good tubes. I'll send them to you if you's like to play with them.

One thing on my project list for this winter is to construct a small AM broadcaster that will accept audio from the 'pooter sound card and rebroadcast it within the house on 1000 KHz. That way I can play sound files, CD's, internet radio, whatever to any old AM set in any room of the house - and there is at least one such set in each room!

I'm going to use the chassis, cabinet, and some parts from a junker catalin AA5 (actually a AA6, I think. And I'm just kidding about the catalin part - did I get your attention? ;-)). I'm thinking a 25L6 PA with series class-A modulation in the negative lead provided by 3 paralleled 25L6s. A 6SJ7 pierce XTAL oscillator will drive the RF PA - I have a nice, big, robust XTAL for 1000 KHz I picked up at the fall NEARFEST. The strongest close-by local signals are WZAN in Portland on 970, and WBZ in Boston on 1030, so that puts me half-ways in-between. Two more 6-volt tubes (6C5, 6J5?) will provide low-level audio amplification, and that way the series string will add up to 118V. May have to use some miniature tubes instead if I run out of space. I plan on using a solid-state full-wave voltage doubler in the power supply. I'm going to try to use the loop antenna for the RF plate tank coil and

antenna; we'll see.

My unsolicited $.02 worth...

I think that depends on where you get the parts. I was thinking about it today. Since I can't get out to swap meets, eBay is the mainstay of parts acquisition for me. I've seen examples of every part in that rig sold on eBay in the last year, and when I add up what they are going for, plus shipping on each individual item, add the cost of copper tubing and hardware, I can't build one a heck a lot cheaper than this. Maybe not any cheaper. I wanted to build a rig myself and am glad I did. But considering all the hours that went into parts restoration & construction, for minimal or no savings, I can see the attraction of buying a rig already made. I don't know how common these parts might be at swap meets or what the prices are like that way, so what I've said may not be true for the average builder.

Lou,

I wasn't complaining. Merely pointing out it's not as cheap as one may at first think. I consider it a great privilege to be a part of this aspect of the hobby and member of this group. I'm loving the building of '29 stuff and there are five more projects in the queue when I find the parts I'm seeking. After that I'll be cooling it for a while though... I do want to keep my house as a shelter for my vintage rigs!! :)

I installed the new audio transfomer (New to the rig) Modulation is fuller. I padded the tank circuit. It took two trys but Ive got it down to 3725 right now. The osc will go a bit lower, maybe 3650 but I am in the AM Window now. I am able to get over 5 watts on the meter output. The amp behaves well down here. I also am making a new amp. Racer style.Dual Chrome caps. Dual coil stacks. Big black tube. I have made three different amps so far. Each one leads to the next one.
I have a base-loaded short 80M antenna (inverted L)Seems to load up Ok with or without ant tuner. Tomorrow when conditions are god I will try it out. Also on tomorrows schedule is a mild rework of my 45 Hartley.

Of course, it is the experience of building it, and then using a rig you build yourself (especially this particular kind) that is priceless.

Topic: 4615 Message: 4838

I said from memory and I havent got much left. Frankly I dont care what year a tube was first made.Those worries weary me. I made my three pre29 rigs and I run a complete station rx and tx pre 29 , not a 1 tube hartley with a Collins R390 for instance. I have 7 other pre29 rxs sitting around me. I like 30s and 40s stuff a lot. I also have built although I dont have any right now 9 pin minature stuff. If it isnt a transistor that to me is important. (although I have 4 or 5 homebrew of those too.)The book was in the car and it was raining so I wasnt going to go a get it. I will now though , hang on..... 6J5. page 253.
I guess my lack of interest in that stems from the fact that I am no contester. I like a more relaxed pace. I do this for fun. In a contest someone else will alway likely win and who knows if he used what he said or not. Like worked 120 countries QRP???? What did he do . Pack the radio and in his suitcase and fly there and operate? I quite frankly dont believe it. Of course I know others doubt me when I am running the Kenwood busting pileups on 20 that I am running barefoot with a ground mounted vertical built from used copper pipe. So be it. Anyway I rant all that to say this. I like vintage style tube stuff. All of it.
I especially love building it. First date of many manufacture of the tubes is to me unimportant. Please forgive me. I understand not everyone feels like I do on that and that is fine by me too.

Of course, it is the experience of building it, and then
using a rig you build yourself (especially this particular
kind) that is priceless.

Y'all have guessed by now I'm not much of an operator but the experience of building it certainly was priceless. I've been building "modern" stuff for 30 years but in many ways this project was a lot more fun. Not to mention it wasn't until this project I learned certain skills, such as how to bend a brass strip cleanly without a brake. I'm hooked. I wish I had discovered this aspect of our hobby a long time ago. Better late than never, eh?

73,
Paul

Hi Paul et al,

I've been a homebrewer for the entire width & breadth of my 40+ Ham radio career, and as you've just discovered, there's just SOMETHING about building these wonderful "...time machines"...

I don't know if it's the liberation from the conformity to modern day design (shielding, bypassing, etc.), or the fact that we are, effectively, recreating history, or what---it's just a wonderful, magical feeling that is unmatched by any other facet of Amateur radio.

What a wonderful niche in an already grand & glorious hobby.

I don't know if it's the liberation from the conformity to modern day design (shielding, bypassing, etc.),

Well, I almost mentioned in my previous note, it was a relief not to find myself needing to sneak a tiny washer and nut 12 inches into the guts of something through a hole not big enough for a mouse to squeeze through!

For me there has always been something about those majestic globe tubes, the copper coils, beehives, etc. These rigs are just pretty to look at. They "speak" to me somehow. Then there is the magic of a hand full of 80+ year old parts mounted on a board actually putting out a decent signal.

73,
Paul

Don, I think you may have misread my point. I was only pointing out that a 6C4 would not be found in a 1940 design, because it hadn't been "born" yet.

> The book
> was in the car and it was raining so I wasnt going to go a get it. I will

OK, a 6J5 certainly was available in 1940.

Nice rant! ;-)

> I like vintage style tube stuff. All of it.
> I especially love building it.

Me too!

> First date of many manufacture of the tubes
> is to me unimportant. Please forgive me. I understand not everyone feels
> like I do on that and that is fine by me too.

It's only important to me for events like the 1929 Bruce Kelley QSO party, or if I'm trying to build something true to a specific time period. The selective nature of the event like the BK is what makes it fun and special. There would be no point to having the event if there was no equipment restriction - there are plenty of contests like that already. But, if that doesn't float your boat, that's perfectly understandable, because we all have different interests.

I am not trying to impose any restrictions on you, Don, or suggesting that you're doing something wrong if you build something using, say, a Nuvistor (Horrors! It rhymes with "transistor! :-)) Again, i was just trying to clear up the contradiction between "6C4" and "1940," that's all.

I'm game. I'll be using my '59 rig (that's the tube, not the year), with a
1810 rock. Puts out just a coupla watts. I don't want to mess with
changing coils on the 1929 rigs in the middle of the QSO party, and since
it won't count as a BK QSO anyway, I don't have to.

I may have another 1929-compliant rig rig built by next year's QSO party - that would give me a total of 3 - one each for 40M, 80M, and 160M.

Yesterday I went over to my friend Paul KB1IAW's to get a piece of wood cut on his table saw. No, not for a radio project, but to repair my mailbox which took a hit from a baseball bat the previous night by some mindless teenager (probably). Paul is a cabinetmaker, and has kindly provided materials and talent for many of my projects. He made the "breadboard" for my Hartley, and the bases for both my Tesla coil projects, for instance.

But I digress. Yesterday when I was over there, Paul gave me a three-dialer carcass, the remains of a "Standardyne." Nothing left of it except the bakelite panel and base, 3 variable condensers (capacitors weren't invented yet!), knobs, filament switch and rheostats, and 4 bayonet standard 4-pin tube sockets, A perfect foundation for my new transmitter! Here is what I have planned: 841 Hartley osc. into 865 PA, and an on-board modulator for AM capability: a '10 driving a pair of PP class-B 841s. The '10 will be feed from a carbon mike ("carbonium microphonium" in east coast AM vernacular), or 600-ohm audio line feed if I want better audio quality. I hope to make it play on 160M, 80M, and 40M.

So many projects, so little time!

Nice rig, Lou!

Besides 1810, I also have XTALS for 1803 and 1802, so look for me calling you off-frequency.

I can also run a 1625 in the tritet if I need more power; it just needs a jumper from the tube socket to the plate cap, and of course, a change in filament and screen-grid voltages.

Which reminds me - I found my long-missing '10 Tuesday nite. It was in one of my tube boxes which I had gone through at least 3 times previously searching for it. This time I wasn't even looking for it; I was after an 807 (not the thirst-quenching variety, the other kind). Go figure.

Nuvistor! There is a word I havent heard in awhile.
While I am waiting for my power choke to come so i can soup up my Pa with some real volts I began collecting and organizing parts for the 56 tube transceiver project. If nothing else it will prove interesting. I also spend an hour with the 45 tube hartley trying a couple of things. It makes decent power. Will light the 11 watt bulb I am using for a dummy load. I am not getting that much out of my 6L6 amp.

BTW speaking of transitors and stuff there is a poem I wrote on my web site http://seniordragster.bravehost.com/ on the ham radio page at the bottom you all would probably enjoy. It may be used by anyopne here anywhere as long as you put the author's name under it. (That would be my name) In one of my other lives I am an writer. (You would never have guessed that from my spelling would you ;.))
I have my AM rig now all working on 80 meters as well as 40. The amp works well down there and idles properly. It was not so well behaved on 40M. Do you suppose it needs a neutralizing circuit? I wondered about linking the plate back to the grid with a gimmick cap or am I off track here?

Maybe.

> I wondered about linking the

Nope, that would add to Cgp which is why neutralization would be needed in the first place. The neutralization feedback loop requires a phase shift of 180 degrees. For a single-ended stage typically one would use a balanced tank circuit in either the grid or plate and take the opposite side of that tank from the grid (or plate) and couple it through a small adjustable neutralizing cap to the plate (or grid).

But, if you use an 807 instead of the 6L6 and paid careful attention to layout, you wouldn't need the complexity of neutralization at 7MHz. Often an aluminum cylinder shields the bottom half of the 807, or the socket and bottom part of the tube is recessed below a metal chassis, to help isolate the gazouta from the gazinta. It may even be possible to get the 6L6 to behave without neutralization at 7 MHz with a good layout. The higher the frequency, the more difficult it is to get by without neutralization.

73,
-Larry/NE1S

So I have a tank circuit in the plate side of the final. I couple it back from the side farthest away from the tube to plate cnnection back to the grid through an adjustable neutralizing condenser.. While fooling around just now I was able to get 11 watts on the meter by adjusting everything to max but Icant idle there I can get some idle at 7 watts by adjusting the bias control but it works absolutey perfect at 5 watts. Pa is hand senstive so atthe bias control . changes slightly when I move away from it with the screwdriver. I cant use an 807. It doesnt have 8 pins. I could use a 6146 , naw that would be cheating. Anyway I am working on this neutralizing thing.I will quit fooling with the power and get that done. MEANWHILE I think I am addicted. While "reading the mail" this morning on the 3705 breakfast club and beyond. I cleaned up an old 5 pin socket and rewired it my colours (Fil twistedpair black. Cathode black, Plate red and Grid green.) I also wound three coils and link assemblies and shellaced them This is my new 1 tube 56 transceiver. If it is a stable as this one is I will try to modulate it as well. I am running out of room!

Good Day All,

Wow...

I just finished-up logging all of the dial settings on my 2x203A Colpitts rig for both 80- and 40-meters, into a 52-ohm dummy load. That note sure does sound sweet, too---hardly a trace of chirp, even on a "high" band like 7-MHz. But I can see that I'm gonna have to (again) place my key on a separate lap stand, away from the table of the rig, on risk of affecting the signal stability / note from my shaking of the rig's support as I pound brass!

Here's hoping now that we aren't buffeted by heavy winds this weekend, or it'll all be for naught ("Wind wobbulation, here I come!").

The ARRL 10-meter contest is on this weekend, but I never bother with it---far too easy to make exotic DX QSOs there, for my liking...

Nope, I'll be MORE than happy to log a certain "VE7", as well as a few other western / mid-west types, on the bands come Saturday & Sunday...provided they are NOT "...pure DC" of note, AND somewhat less than "...crystal control" in terms of frequency stability (a little bit of chirp sure wouldn't hurt either). Glad to hear the "Yodeller" is cued up and ready to .. uh... yodel. hihi

Yeah I think most of us have to have the key off the table. Mine sits on the wooden arm of the operating chair. That has it's own issues because I've knocked the key off the arm at least three times. I was susprised one year to observe the frequency wobbling when my daughter would dance across the floor above the shack.

Yeah none of that dc-note stuff please. The tone quality this year has probably been the best I've heard unfortunately. No one was running raw AC on the plates this year. Sad. I loved hearing that tone. I only heard a few wonderful sounding chowpee-chowpit signals.

I've got the 2x210 Colpitts (your circuit) ready to go on 40m and 80m again. I just didn't get time this year to build up my new 40 meter transmitter using the LC tank circuit that John Rollins built for me. I have the 211's, four of them, so I've got plenty of firepower.

Hey if anyone has some 816 Mercury rectifiers for sale, I'd like to buy two or three for that transmitter power supply. Thanks.

73, Scott WA9WFA

I tried aluminum foil taped to the tubebase extending up to the bottom of the works in the tube. It made a difference but probably not enuf. I can get the tube to idle both bands but it looses too much on 40 so I will do the neutralizing deal and see what happens. The final in the rig also idleswell and output will sit at zero (relatively) till you speak then it all pops to life. Needles swinging tubes giving off a soft glow from their filaments and a warmth in thr room. Life is good. I am tuned up right now on80M 3705. The band is starting to come around. I will give it a shot if I get an opening. There is an AM rag chew going on right now.

Beginner's luck! You've probably been playing with vintage stuff too long to qualify. ;-)

When I worked Lou the first time it was T7. The second time was T7C. But after swapping power supplies to get rid of the modern Stupid State devices that were objecting a teensy weensy bit of stray RF it became borderline T8/9. I think it sounded far TOO good, but being a newbie what do I know? :)

My key is bolted to the operating desk, and the rigs are on shelves that
are part of the unit. I do get a bit of mechanical modulation.

I don't know if Stu W2AO runs RAC or not, but his signal was about a T5.

I may have a pair of used ones for you, but I don't have a good way to
test them. They test OK in the Hickock, but that doesn't begin to apply
normal operating voltage, or draw normal current, so I'm skeptical that
it's truly representative of their condition.

Oh! My most humble apologies, Mr. Elmer, Sir. Thank you for the warning! When building my vintage power supply I shall be certain it imparts a big of "woop woop" to my signal. And I shall endeavor to have my cat bounce around the house so as to ensure the signal is not always entirely steady. Will that do?

Bugsy

Don't forget about the type 82 either. It is much cheaper than the 83 since it is not used in tube testers. It is also a year or so older and thus commonly available the globe shape.

Hi Don,

To a 1st approximation, increasing the voltage on your linear amplifier will only increase output if you have reserve power from the exciter with which to drive the amp. In other words, if you have enough drive to saturate ("flat-top"/distort) the linear amp stage, then increasing the voltage will give you more output. If you have 4X the drive you need with the amp at low plate voltage, then theoretically doubling the voltage on the amp will allow you to drive the amp to 4X output. (because the plate current will double as well as the voltage).

I really, really like push-pull RF amps. As long as you keep the layout neat and symmetrical, they seem to be better-behaves than single-ended designs. Very easy to neutralize too. They require two identical neutralizing capacitors, each one goes from grid to opposite-tupe plate (or plate to opposite-tube grid, if you prefer ;-)). Of course if you are using tetrodes (and you are), neutralizing may not be necessary on the lower bands. Did I mention keep the layout clean and symmetrical, with short leads? Of course you will need center-tapped coils and split-stator air variables in the grid and plate circuits, with link-coupled input and output (although I suppose you could use a balanced pi-net on the output if you were feeding a balanced antenna system, or on the input if you were feeding it from a balanced source. But I know you aren't, so that won't work for you.) It's easier to get a push-pull stage to behave on the higher frequencies, because the parasitic tube capacitances are effectively halved. My Old Buzzard Rig, which uses push-pull 812s in the PA, is presently playing nicely on 29 MHz.

BTW, 2 tubes in push-pull will suck twice the DC currents (plate, screen grid, control grid if applicable) as a single tube, because they are in parallel as far as DC is concerned.

Good Luck!

73,
-Larry/NE1S

4901. Distinctive BK Signal

Yahoo group: AWAGroup (2010 — 2011)

The most "distinctive" signal I heard on the BK last weekend belonged to Steve, N8YE. Afterlooking carefully at the T-scale description in my ARRL Logbook, I decided to give him a T 3, "Rough ac tone, rectified but not filtered." He responded that he was using a 1925 TGTP with a Ford (spark) coil, presumably for his B+ supply. Look for him on 80.

Jim, W8KGI, New Mexico

OK. Very informative. I am in a snag with the variable caps so I will have to go parallel for now till I find some. I will put it on the "ust do" list. The amp is very symetrical and close together . My familie in the old country would say "Alles in ordnung"
So if I double the voltage to my current amp I will get 4 times the power providing I have sufficient drive. Do I have that right?
The would give me probably a usuable amount of power or enuf to get above the noise. I built the PS with a choke although I see many no longer use one. I may build a newer style PS and find a match to my single butterly variable. I could also gear a pair of conventional togther for the same result I guess. Thanks for your help. It is a great beniait to me and has been already to get this amp I am usung working nicely.

I did some very interesting tests today withthe 6l6 and alumnum foil taped around the base. It behaves if the aluminum foil isonly around the baklitebase and up the glass to just before the guts are visable. If I go above it thetube actssilly again only not controlable. This tells me I think that it is neutralizing itself with the tin foil as long as it isat the bottom .During those monents when it was uncontrolable (foil too high. It easily pushed the meter past 11 watts so i assume t was generating its own oscliations. With exciter when all is adjusted right it can push just past 5 watts now. SO I said why can it make 11 watts itself and onlly 5+ wattsfrom the exciter. You mentioned not being driven hard enuf. So I remebered the 6v6 in that circuit is a buffer amplifier andwas designed more to isolate the VFO than boost the signal. I copied most of that part of the circuit so as I have already suspected my little 6v6 is standing in the way between my 50C6 final tube (swapped it for the 50L6. It works better). So I knew there was a voltage dropping resistor in the 6v6 plate circuit. 5600 ohms . Key down volts on the 6l6 was 355.At the same time the 6v6 is running only 197 volts. SO if I raise the plate voltage at the 6v6 to say 250 I should be able to drive the 6l6 that much harder . Is this right? How much drive do i have for the 6V6 from the rig. I measured it several times. It is a solid 1/2 watt. I think that should be enuf to make a beam power tube dance. I am going to try that. Ithink something like a 3ooo ohm resitor in place of the 5600 would do that and then i ask why have the resistor at all? Why not run both tubes at 355volts ? The difference the the 6v6 vrsa 6l6 should keep everyone happy. Unless I misunderstand beam power tubes they dont need a huge drive to give them full power say like a triode would.
Sorry to bother you again with al these dumb questions but you have been a big help thus far.
Don VE3LYX
BTW went down on 80M 3572 tonite. I was sure I heard Bills CW rig but didnt hear the callsign. Then I heard K1VVC calling CQ AWA and went back to him Cw mode twice but no reponse.

Tested 3 different tubes. 6l6gc needed foil . Old style Black jan 6l6gca does not. 6l6-eh (tall boy) doesnt need foil but required about a 10% different bias. Power output of all three was the same on the meter. Any difference was not discernable to my eyes.
For the little 56 tube transceiver project I have a 42 tube (pre 6f6 tubes) If I get the little guy working rght I left room to mount it on the board for some real power! It came from the same radio as the 56. I keep looking at that 56 tube. I think it is late 29 but I know that is a lost cause to push the issue. I know big production common use wasnt in gear till 1930 but I did read somewhere where they were being made up here in the GWN earlier. I should have printed it when I read it. All the other 56 tubes I have are coke bottle shaped like 30s tubes. This one is not.

Good Morning All,

Well, as Ralph Kramden was wont to say so many times on TV, "...I'm having a regular riot" on the 1929 QSO Party here...!

I started-out fresh on 80-meters with a blank log sheet in front of me right at 6:00 PM sharp last night, & just completed my 7th QSO on 40-meters---upstairs for some brekky now. But WOW! Conditions have been really good (on 80, anyway), & so far I've made a grand total of 34 QSOs.

My best DX was---as usual!--Steve(VE7SL) in BC. Also a thrill to work the ultra-rare State of Montana, & am especially pleased to have logged stalwart amigos WA9WFA & VE3AWA. REALLY nice, too, to log NE1S, N8YE, & other friends on both bands.

I think the decision here to go back to The Rollins Rocket 1923 p-p Colpitts was a good one: I can not believe the cleanliness of the signal emanating from that rascal this year! As Larry pointed-out, it seems to be extra stable this year. If I do say so myself, I think its signal quality is the equal of many MOPA rigs from the period---just as long there's no wind blowing the antenna around outside, & I don't disturb the operating desk in the least little bit, that is...!

Anyway, I'm gonna leave the set-up warming-up on 40-meters, & will check into things from time to time as the day unfolds here...as evening approaches, I'll most likely go back to 80-meters. But as the old adage goes, "...SO FAR, SO GOOD!"

One way to tell if a particular specimen of a 56 did indeed come from 1929 would be to look at the
bulb. It would have to be an S-14 bulb since the S-12 wasn't invented
yet. At least in the US, the 56 was not released until June 1932.

Hi Scott (WA9WFA)...

I just called you on 40-meters a few minutes ago---you had finished a QSO with N9HAL.

I guess propagation on 40-meters isn't too red hot to-day---hearing very few '29-ish stations now...and wouldn't you know it, but the wind has picked-up here (along with my "...windward wobbulation"! Hi Hi).

I have a 90ma choke coming for my higher voltage PS but I think it is stuck in the mail. So using a trick my paw taught me I took an audio transformer secondary and paralleled it with the choke (they look identical BTW) It will kill my inductance but I wanted to try the the extra voltage, about 40% more. Last time I turned it on the small rcver choke was sending smoke signals but with a second current path all is well and cool. There is a bit more hum than I would like but I just cut the choke inductance in half with the second "choke" deal so I knew that would likley happen. Power? I am now showing 18 watts on the peak output. I believe there is hope!

The cams turn at the same speed as the crankshaft, so it must be a 2 cycle engine. Pretty good for a V-12. I've had a Lincoln V-12 amd a Cadillac V-12, and neither of them ran that smooth.

4923. B-K observations

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-11 23:18:15 UTC
From: Steve Flood
Topic: 4923 Message: 4923

It was only my second B-K and had a great time again.

I heard fewer calls from the west side this time - most notably missed this year were W7DRA, KB7NRN and W7OIL. Where were those guys???? Some of the eastern contingent not heard at all - WA3FFC, WA1JAS, WA9QNN, N9HAL. There were some elusive stations in there too. I could hear them, but no dice on their end (N2OUV, N9OB, K1TMJ, WA8ZWJ, WB5NPW, WA8DOF and W1GIG).

The MOPA ran very well and has now earned a spot on a nice cherry board for a final build and will get some operational and layout tweaks as well.

So then, was the move to 7105-7115 a good one? Seems like there was lots of crud there with shortwave broadcasters and SSB, but being away from the digi stuff is a plus. Seems like we are on again with the SKCC/WES crowd in either spot.

73 all,

Steve KK7UV

Hi Steve,

Yeah, but of it's of any consolation to you, you got ME in your log!!! Hi Hi

I think the migration on 40-meters up to the old Novice band was a good move. I still experienced a lot of intermittent raspy noise on the band there, but it could very well have been locally generated crud...

Ended-up with a final grand total of 42 QSOs. Not too shabby, I think, for operation on the 2nd weekend alone! Best DX...? VE7SL, hands down.

I was VERY pleased with the performance of my p-p Colpitts rig. It sounded extremely well the first night, but the wind to-day took its usual toll on the steadiness of my signal...

It was fun to put "VX3" in the log books of those who could hear me---many thanks to all for another good time...

Yes. but "sufficient drive" to get that result will be 4X the power you are now feeding into the amp.

In other words, raising the voltage to the amp will raise the saturation point (allow you to get more power out by driving the amp harder and do so without distorting the signal).

"most notably missed this year were W7DRA, KB7NRN and W7OIL. Where were those guys????"

Yes, I was AWOL for the BK this year. I was trying to get my 845 Hartly up and running but was

struggling with a bad variable cap. I ended up just getting frustrated, I really wanted to run

40 mtrs this year and that's what the 845 was for.

I ended up changinfg gears and put together a complete homebrew 40 mtr station for the LC contest.

I have my Regenerodyne receiver mated with a Jones push pull transmitter using a 6SL7 and I built a

CW monitor. Have already made two contacts with the station, Utah & So. Cal. Been working on an

antenna T/R & mute switch using a DPDT knife switch. That way I only have to flip one switch instead

of two...

Homebrew station photo attached.

Hopefully for the next BK I'll have a 40 mtr Hartley up and running. I picked up a National DX variable

cap and a 245 tube at a swap meet. This will be the basis for the next transmitter.

I'm also starting on another superhet receiver. This one with xtal filters.

John

4928. B-K observations / VE7SL

Well ...another delightful QSO Party completed and it was just as much fun as my first, three years ago. Unlike the last two however, when band conditions were superb, weekend #1 was terrible out west. Things perked-up significantly for weekend #2 when I was able to work many of the stations missed on the previous Saturday. My total QSO count this year is the same as last year, with 44, which included one none-vintage contact. As usual, 80m was the most productive band, producing almost all of my east coast contacts.

My best DX was (again) stalwart NE1S at 2496 miles, followed closely by his neighbor, K1TMJ at 2486 miles. Other notable long-haul contacts were with KC1FB (2449 miles and his 5 watts on 80m!), WU2D (2476 miles) and K1VVC, K4JYS, N4GJV, W2LB, all in excess of 2200 miles.

Thankfully, the wind was not a big factor here this year and my signal remained reasonably stable for the most part. Like a few others, I too envision a MOPA for next year, if only to save me from worrying about the weather. This year I ran the Hull Hartley on both 80 and 40, using the 80m coil on 40m as well, which seems to work just fine. The antenna is the same one used for the past three affairs, full-size quarter wave wire groundplanes suspended from the top of a 70' Balsam at about a 70 degree angle. The base of the antennas are about 20' from the ocean, towards the east, which certainly helps a lot.

A nice QSO was had with Steve KK7UV, on Topband, in mid-Party last night, and although his signal was very loud, no others from the east were heard even though there were a few 29'ers looking west. Conditions on Topband were not good and a quick tune through the normal CW band turned up zero signals...most unusual for a Saturday night and indicative of the poor propagation on 160. Next year, with 160m added to the B-K, hopefully there will be a lot more interest and activity, as transcontinental QSO's are readily possible when conditions cooperate. This year's shakedwon on Topband indicated that I could make the change from 80-160 in 6 minutes...faster than I had envsioned!

I got on 80m early this morning (0400 local) to catch the east coast sunrise enhancement. Loud signals were heard from WA3YNW in Maryland, who was tied-up with a none-contester, scolding him about his unstable signal. By the time he had explained and extricated himself, he was too weak to work. Similarly, a strong signal was heard from W1GIG but his QSO with a midwest station required several repeats and by the time they had completed, Tim's signal had deteriorated. His following weaker CQ's continued in spite of the several mid-western stations and myself calling.

Some other gleanings from my log indicate that 38% of my QSO count came from Minnesota. What an amazing hot-bed of '29 activity this state remains. Has

anyone figured out why and how it can be spread? And where are all the western stations?....no California! and just one from monster size Texas...come-on guys!!

The 40m QSY proved to be very beneficial here, with 17 QSO's on that band compared with my previous best (and hard-won amongst the digital mess) of 8 contacts. Although I noted a few 'CQ WES', none of the stations heard were anywhere near as bothersome as the S9 digital blasts in the old 40m window. And speaking of 'windows', of my 27 contacts on 80m, the average frequency turned out to be 3564, with activity heard as high as 3572 and as low as 3555.

Worked for the first time ever were the vintage stations of WA8DOF, WB2AWQ (Nevada), NI8G, K5RB (Texas), K1VVC (SC) and KI0DB (MN). Notably absent or just missed, were WA3FFC, N9OB, WA9QNN, WA1JAS and KB7NRN.

Unlike previous years, when the propagation was dominated by an east-west path for most of the night, I only heard VE3AWA and VX3XZ very briefly and not with their usual ether-busting signals. It seems that the skip may have been a bit longer and a little south of the normal one.

Thanks for all of the fun and all of the great operating skills demonstrated. I'm always amazed at how many very weak signals respond to my information with a 'QSL rr' the first time. I had only one station ask for a repeat.

I can hardly wait until next year to do it all over again!!

I'm thinking no, because you are trying to use the 6V6 as a linear
amplifier stage. Unless changing the operating point increases the stage
gain (I'm not sure it will or won't). Otherwise, you are just making
saturation point higher, which allows you to apply a larger signal at the
input while maintaing linear operation. Linear amplifiers aren't like
class C amplifiers, which are always run in saturation. This is why output
increases when plate voltage is increased on a class C amp (and this is
what makes plate modulation of a class C stage possible).

> How much drive do i have for the 6V6 from the rig. I measured
> it several times. It is a solid 1/2 watt. I think that should be enuf to
> make a beam power tube dance.

Is that AM carrier, or peak output? If AM carrier, I agree, it should be
plenty.

> I am going to try that. Ithink something
> like a 3ooo ohm resitor in place of the 5600 would do that and then i ask

> why have the resistor at all? Why not run both tubes at 355volts ?

You will have to adjust the grid bias on the 6V6 so that the idling current stays in a reasonable range. Otherwise, I would think the 6V6 can take it.

> The
> difference the the 6v6 vrsa 6l6 should keep everyone happy.

Not quite sure what you mean here.

> Unless I
> misunderstand beam power tubes they dont need a huge drive to give them
> full power say like a triode would.

Yes, tetrodes, pentodes, and beam-power tubes are easier to drive than triodes.

> Sorry to bother you again with al these dumb questions but you have been a

I worked Jon last night. He's a misplaced one-lander, now in SC.

4932. BK 1929 QSO Party Observations - WA9WFA

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-12 02:20:40 UTC
From: whitebear1122@comcast.net
Topic: 4923 Message: 4932

Wow wow wow, what a great time! My thanks to all who participated in this 26th or 27th 1929 QSO Party.

It was great seeing all my old 1929 friends again. It was fun working the usual gang, meeting some new recent additions to the BK, and finally working some of those stations that I haven't worked in years or ever heard. There are still a bunch of New England stations that I still haven't worked yet. I worked several stations that I haven't heard in years like KC1FB, K1TMJ, WA1JOS, WA3YNW.

I was happy to hear AA9DH from Illinois back this year. He didn't participate last year.

I have been processing the logs for maybe 6 or 7 years now and I always come across a bunch of stations that I haven't had the pleasure of working yet.

Plus I heard another 8 or 9 stations that I just couldn't pick up. I heard and called Tim W1GIG after he finished with another station but the band changed and I never heard him again.

80m was fabulous both Saturday nights. At my QTH, conditions were good, band noise low, and now line noise. Probably the best 80m conditions in several years.

40m was fabulous the first weekend. 2nd weekend Sunday morning it was fair, dead till later afternoon. Moving from the garbage pit of 7040 to 7110 worked out really well! There was just a tiny bit of ssb, one AM broadcaster on 7105 at times, and a couple of digital stations around 7105. Compared to 7040 with all it's digital racket, RTTY contesters, high power cw, and SSB, was a vacation! Clearly there was more 40m activity this year than any other year in my opinion. I worked around 19 stations on 40m.

I used my push pull 2x210 Colpitts on both 80m and 40m with a pretty good signal. If you remember contacting me, let me know what the Colpitts sounded like at your station. I heard alot of good sounding stations on 80m and heard more chirpers and chowpee chowpit stations on 40m. I heard a couple of stations that were difficult to copy because their frequency was moving around quite a bit. I heard one raw ac station. I heard one station, and I'm not telling, whose signal was so nasty that I could barely understand the report because the frequency would abruptly and randomly shift from a few hundred cycles to 1 KC or more, in the middle of a dit or dah, doing this wildly. I heard a few of my favorite wind modulated signals.

From my rough numbers I worked 57 authentic 29 stations, about 19 on 40m and 38 on 80m. The only non- 29 station worked was W2AN and I called him because I wanted to hook up with Ed at the AWA headquarters stations. You know, I never liked the rule change where 'the occasional' modern station counted, and I think we should change it back to the old rules, 29 to 29 contacts only counting. Last year a couple of stations were including up to 10 modern contacts in their score. To me this seems to be more than the "occasional" contact that the rule change envisioned, and it skews the scores. I haven't heard of any modern stations contacting a 29'er and then signing up to join the AWA. I think it's a distraction.

Next year 160m will add a new dynamic to the QSO party. The seasoned 160'ers like Eddy and Steve will feel right at home while us newcomers to 160m will be dipping our toe on the water. Gads, that's going to be one big coil if I use the Colpitts.

I was pleased to work some westcoasters in the form of VE7SL, KK7UV, and W8KGI in NM. Don't know why the west coast isn't more active. I've been told by some past westcoast operators that they don't hear anything from the midwest or east coast. I know Steve VE7SL is hearing everyone, and I tell you KK7UV was heard here on 80m and 40m alot of the time. I'll bet VE7SL and KK7UV worked a ton of stations.

Steve asked whats going on in MN. There is a very strong MN group consisting of around 12-14 stations. Much of the reason is due to Harold KB0ROB who uses his 29 equipment all year around. He is telling everyone about it too. He put together a packet of information on how to build a receiver and transmitter, sends it free to people he contacts on cw and ssb. He's shipped parts and tubes for free to newcomers. There is a loose group in MN called the "Mighty Midwest Glowworm Society" and we discuss 29 transmitters and receivers all year around.

That's it from here. Thanks again to all the folks who dig deep into the noise and pulled these 1929 peanut whistles out of the noise.

73, Scott WA9WFA

Most fun I had with a crystal set was using a low curent LED for a diode. RS used to stock them but no longer do. It would follow the signal in brightness but after a couple of weeks they would burn out. I always wanted to put afotocell battery combo across from the blinking LED and put a speaker in the circuit to see if i could havea speaker volume Crystal set with no actual amplifier. I always hav ea couple on hand. So what is in a proximity fuse?

Is that AM carrier, or peak output? If AM carrier, I agree, it should be plenty.

When I measure I turn up the screen voltage which is now vaiable to the full I have available although it is limited so it wont overun the modulation so it is at that point al carrier but I can match it with the screen voltage set back and modulation supplying I think approx 1/2 the screen voltage peak. I had the big power supply on today but after about ten minutes I was visited by "Snap Crackle and POP" I dont think the 6v6 like the voltagethat high. I did get 18 watts. I have put it back on the old supply for now but using my antenna tuner and by careful adjustment I have been able to get over 8 watts on the meter. with very active modulation on the on modulation indicator. I dont know what blew in the PS. I will check it out later this week.

A proximity fuse is an electronic fuse for projectiles, with a built in transmitter and receiver. The projectile doesn't have to hit the target. When the target is within the range of its transmitter signal, it sets off the primer and explodes the projectile. The early ones during WW2 used tiny tubes. Now, of course, they're all solid state. If you're in the Regenrx Yahoo group, go to the photo section and look at my "Mk.19."

Actually, it's not a transmitter and receiver. It's an oscillator the is affected by the presence of anything that absorbs energy from the oscillator. It doesn't arm itself until it leaves the gun barrel, although we have had some "preemies" go off in the barrel or just out of the muzzle.

OK. 8 watts resting carrier is about right for a 6L6 in linear service, if the plate voltage is high enough. Peak power out will be around 4X that, so you need to tune up the amp with the screen voltage on your AM exciter way up to allow that, or your amp won't have the headroom required for modulation peaks.

At one time I ran an 807 (basically a 6L6 with a plate cap and 5-pin base) with grid modulation - another "efficiency modulation" scheme, similar to linear amplification of AM. I got 7W carrier out, but needed to tune it up first at 30W output.

GL with the power supply.

4940. The A supply problem

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-12 14:40:51 UTC
From: N1BUG
Topic: 4940 Message: 4940

Hey guys,

Mr. Obnoxious here again, in a quandary.

One of the projects in my queue is a power supply for receivers, late 1920s era. I know, I know... batteries. Call it a character flaw if you like, but I despise batteries almost as much as I despise the oft beloved Fahnestock clip.

The B eliminator is no problem. Got it just about covered. Even if not entirely typical of the era, I like what I've come up with. It will use authentic period parts (except maybe one pesky power resistor!) and period appropriate circuit. Hence there is no reason it couldn't have been used back then, and perhaps something much like it actually was used by someone. That makes it acceptable under my own personal set of guidelines.

There is, however, the matter of that pesky A supply. For my first receiver, I will need 5V at half an amp, but I would like to have a bit more current available for any future "deluxe" receiver. The tubes will be UX-201A, so I need pure DC. I've been searching for information on how A eliminators were constructed but have found precious little on the subject. My gut says period correct rectifier and filter condenser(s) would be a huge if not insurmountable problem. Am I right? Any ideas for a true period correct A eliminator? Is it possible? Practical?

My other thought is to use what appears to be a period correct battery, with a modern power supply hidden inside. I need a little coaching and eduction before I tackle this. Other than lead-acid, what else was available for A batteries in the late 1920s? Is a set of four 1.5V dry cells authentic enough? I'm assuming there was no such thing as a 6V dry battery that could supply the demands of even a two-tuber, let alone anything bigger.

I think I may have blown it yet again! Recently there was a fellow selling nice-looking reproduction A batteries (round, large 1.5V dry cell) on eBay. Something tells me I may be about to regret not having bought four of them when I had the chance!?

So many questions!

73,
Paul N1BUG

Proper parts to build an A-eliminator would indeed be nearly impossible to find. I think it would be far easier to find an actual A-eliminator from the 1920's.

Dry cells would be authentic to use if you were running UX-199's or similar tubes, but 201A's were used with storage batteries.

Using 199 tubes is an option. The article for the receiver I'm planning to build specifies either 199 or 201A tubes.

Good Morning fellow '29ers,

I think some of the previous posts have expressed my sentiments exactly...wow, holy cow and woop-de-do!!. Yep, another excellent Bruce Kelley event. I went back into the old OTBs to see just when my first BK was and it was in 2002. My score was 13 contacts using a TNT at 1.75 watts input. Over the ensuing years, I have managed to increase the score a tad plus now I'm QRO with a '29 Hartley & a 210. Big improvements but I think I still have about as much fun, each event, as the first...well, the first was a bit more since I was amazed at what the CX-301A /TNT could do. This year, I made two contacts with the TNT...it still works, but the pwr is now at 5 watts input. I'm pushing the 'lil '01A a bit.

It was a pleasure to work many of the regulars. Larry, NE1S was my first contact this year and K1TMJ the last. I also was lucky to be able to work some of, what I would call, the 'DX' stations:
K5RB, W8KGI, VE7SL, KK7UV, VE3AWA, & VX3XZ. I worked several new stns, to me at least, K1VVC (SC), who was booming in here in NC. Also, WA8DOF, who has already sent me a QSL, W9TFC & WX1O, who gets my 'most unique signal' award. I worked Steve N8YE on 80/40 and hrd him later on the Ford coil rig...great sound. I always look forward to working Ron, N4GJV, here in NC, who has helped me over the years with '29 circuit questions. I worked ten MN stns...Scott, how about a WAM award? It was also a pleasure to get Harold, KB0ROB, in the log...he also helped me with a tube and info...great guy. And of course, it was a pleasure to work the 'boss', Scott at WA9WFA. To each and everyone I worked...a hardy thanks for making this event the best in ham radio and cudos to you too, Scott!!

I think the move to +7.1 was, in general a good one. Not nearly the digital crap as the previous window...except just above 7.1. I also experienced the SWBC stn QRM. I was making my last QSO with K1TMJ, just below that stn, and just as Jim was giving the RST, the SW stn started modulating. Finally Jim and I QSYed and got the necessary fills...he was 5x6, but the modulation wiped him out. I took a break this Sunday afternoon and listened to the VE am stns around 7120...and dozed off. Condx were, well ok, I guess. I gave out about eight 3x3 reports and if it hadn't been for the WW2 range filter in the phone line, I'd have missed them (rcvr was a Drake 2B). I don't know what the avg. age of the BK participants is, but we as a group still have some pretty good ears. I missed a couple of stns, who I usually put in the log...so condx had some ups and downs. But, the total contacts was good and the fun was...well grrrreeeATE.

I'm already looking forward to next year and in the mean time, I hope to participate in other upcoming AWA radio events....73 de Bill K4JYS

I have to get this day started, but before I do, one final comment. I asked myself whether using "fake" dry cells with modern power supply concealed inside to power a receiver containing 201As would violate my personal criteria. It's a gray area. The power supply would "appear" more or less correct-ish for 199 tubes, but would in fact be powering 201A tubes. I have no immediate objection to such a bastardization of my goals. I might be willing to do that since perfection of the overall setup I have in mind in every detail is not practical. Assuming, of course, I can create a reasonable facsimile of old dry cells.

I of course remain VERY open to any and all suggestions in this matter of the A supply.

I was on for both weekends of the BK. The first was sort of a bust. I was operating as K5CF in Oklahoma using his TNT transmitter running about 6 watts. I heard several of you but no one copied me. Vance's multiband vertical was probably the problem. This past weekend I was back here in MN and had (for me) a good QSO count running my Hartley, all on 80.

Thanks Scott for working to allow the BK to happen. It is always great to get on using my TNT or Hartley and work others using similar rigs.

More details are in my blog at http://w0vlz.blogspot.com/

Hi Leonard,

Thanks for the picture. Nice job on the batteries. I have seen some scans of old batteries but they did not seem to specify the size of the batteries. Perhaps I missed it. I will have another look around.

It may be assumed the scans will automatically print out at the "proper" size but I can guarantee that will not happen here. I have to experimentally scale everything I print to get it to the size its creator intended.

Thank you Scott for your great efforts. The new 40 meter frequencies were a great idea. Mailed my log this year rather than email so i hope you get it.

Conditions were the best I remember for a bk. I think I was able to work just about everyone I heard. A good number of signals had wonderful character. We should probably keep track of the states we get oo reports from and see if we can collectively claim a worked all states oo. My hartley mopa was very sensitive on 40 and sometimes decided to find a new frequency on its own. One leg of my antenna snapped in the wind on the second Sunday which greatly affected my signal. Doing antenna work in December seems a little early. Most of us in Minnesota wait until January to work on antennas.
Minnesota is a great location for working the bk being we are right in the middle. The down side is that we tend to drown each other out calling awa. Most of the midwwest glow worms seemed to be active with a number of new ones joining the group.

thanks to all for a great get together.

Last night my brother Dan who lives just a few miles away listened for me on his Stewart Warner R5101 that some idiot (that would be me) sold him for a mere $75 dollars some 27 years ago. It is complete and in its original cabinet (metal box) it is apparently a Canadian Navy Receiver and comes complete with an Audio Deck and Crystal Calibrator in the same cabiunet. Joe Cro who I see is known here had a note looking for info on this model radio. During the course of our phone converstaion Dan went poking around the radio and found four folded schematics (about 4 feet square)for both the Rf section and the audio deck. He also found 11 spare tubes in the same hidden compartment. (I had never looked)It still appears to work perfectly. I could hear he was hearing the same conversation as I was so frequency wise it should be right. It sounded good too.
It is interesting to note my signal did not come through there. So I hooked up my big rig TS830S and called CQ. It didnt come through either. Is it possible that it misses him even though we are fairly close? (about a 4 to 5 minute drive.) Anyway I digress. joe Cro was looking for info. Dan said to call him and they could arrange for Dan to reduce the schematics to page size as long as the cost was born . I beleive this vintage reciever was made at Stewart Warner right here in Belleville Ontario.

Don, if that Radio magazine article shows how to build the A eliminator I would very much like to see it. If it's not too much trouble. It may be impossible to find the old parts but if there is any chance, building a period correct eliminator would be my preference over any other option.

Hi Paul,

I'm not sure, but it's possible that early "A" eliminators may have used Tungar rectifiers. These were low-voltage, high-current devices.

I heard a rumor that No.6 dry cells were still being manufactured and are available, but that they are pricey.

73,
-Larry/NE1S

P.S. I may have an 874 for you - let me check and make sure. If I do, you're welcome to it, the only catch is you're going to have to come down and get it, so that I can meet you and force you to endure the grand tour of the NE1S station ;-)

Hi Larry,

I will research Tungar rectifiers. I hadn't heard that term until read it in your note! There is much I don't know. I have seen a couple of old A eliminators that used metal rectifiers of some sort. I assume either copper-oxide or selenium. I wonder if any of those devices would be still operable today. An even bigger issue would probably be finding a high value filter condenser from that period. Even the far more common low value ones are next of kin to hens' teeth. ;-) I'm starting to think this is another item we need to make replicas of from scratch. If only label scans and exact dimensions of a few types were available!

Please don't put yourself out looking for the 874. I appreciate the offer, but the travel is unfortunately not possible. Otherwise I'd love to come to meet you and for the tour, with or without further incentive! I believe I am on the trail of a UX-874 that can be had for some $$.

Lou,
These things look a lot like the Mallory "Bias" cells of the late 30s through post WW2.
You can do much the same thing with the square lantern batteries. Some are a bunch of AA cells. I had an email about it. If I can find it, I'll send it along.

My RX is a all valve (tube) set based on a design from the 1959 ARRL handbook, called the simpleX super as its a superhet with a xtal filter: but in my case the filter is an improved ladder filter design by Dave G3UUR

the TX is is a single 807 xtal oscillator running into another 807 as the PA with a maximum of 50 watts out (700 volts on the anode of the PA) most of the xtals are hand ground. The TX began life as a single 807 power oscillator with a input of 10 watts and only 3 to 4 watts out to aid stability

I also run homebrew SSB gear which I use on the hombrew net, the net is on 3727 most days at 1pm clock time. The aerial in both cases is a 140 foot end fed but on SSB I use a screenmed loop on the RX and on the simplx super RX I use a noise nuller/steer'er

The SSB RX is quite posh having a H mode mixer in the front end and a huff and puff VFO

Speaking of filament voltage, what happens if you power a 201 tube with 5vac?

The reason I ask is, I have a 2A3 SET amp that uses 2.5vac for the filament supply.

Paul, if you're near a battery shop you might be able to find an old 6V car battery carcass. You could clean it out and build a heavy duty "A" supply inside it. But 6V car batteries are as scarce as WD-11's now. You may have to build a "look alike" battery box.

I have to get this day started, but before I do, one final comment. I asked myself whether using "fake" dry cells with modern power supply concealed inside to power a receiver containing 201As would violate my personal criteria. It's a gray area. The power supply would "appear" more or less correct-ish for 199 tubes, but would in fact be powering 201A tubes. I have no immediate objection to such a bastardization of my goals. I might be willing to do that since perfection of the overall setup I have in mind in every detail is not practical. Assuming, of course, I can create a reasonable facsimile of old dry cells.

I of course remain VERY open to any and all suggestions in this matter of the A supply.

I was only going by what I have spent on parts for just such a transmitter. $50 for two cardwell variable caps, in addition to the Hammerlund vari cap. and a boatload of other air cariable caps of smaller capacity. This also includes some aerovox mica caps. This was an ebay purchase. Anything else I need will come from POTP, who has good prices.

$20 for copper $15 for an 01A tube and another $10 for a tube socket, grid leak, fahnstock clips and other small hardware. So I am at half of the selling price of the ebay auction.

Paul, some of the scans include the actual measurments, but even they can be scaled to whatever size you want. Unfortunately, rescaling destroys some of the detail. The #6 dry cells were made with 2-5/8 inch diameter mailing tubes.

Hi Leonard,

Thanks for the picture. Nice job on the batteries. I have seen some scans of old batteries but they did not seem to specify the size of the batteries. Perhaps I missed it. I will have another look around.

It may be assumed the scans will automatically print out at the "proper" size but I can guarantee that will not happen here. I have to experimentally scale everything I print to get it to the size its creator intended.

Paul

Hi Lou and all, Yep that's me with the heavy iron stations from maybe 10 years ago including the Collins KWS-1 transmitter and 75A-4 receiver, Collins 32V-2 transmitter and 75A-1 receiver, Collins KWM-2A station, then the Johnson Desk KW amplifier with Ranger II. I've sold all except the 75A-4, Ranger II, and KWM-2A station. I've been in a major downsizing selling mode for the past year, selling around 70% of my radios. In lieu of operating I've been having to box and ship. It sure was alot more fun to find, buy, open, and use. Selling ain't as much fun :)

Oh you found the photos of the 29 Colpitts. It's a 40m Colpitts and I temporarily tacked on another set of fixed capacitors to help tune it to 80m. The temporary lashup has been temporary for 2 or 3 years now... This is the rig that I used in the 29 QSO Party. Eddy VE3CUI says it sounded fabulous on both 80m and 40m this year. I wish I could construct it to look as nice as Lou's stuff.

I tried a gimmick cap switched antenna deal. It works very very well. Regen is smoother . Signal is as good if not better than before. Of course one now has a tuned antenna circuit on both recve and trnsmt. (and less you think it isinefective let me assure it is works very definatley. I made my gimmick cap from a twisted pair of stiff hook up wires. About 5 or 6 twists.
The radio gets more fun by the minute.
Don Ve3LYX
My Dad taught me about gimmick caps back about 1964 when I was building my first regen. He explained that many regens dont perform because the circuit is too tighlty coupled. The gimmick is quick and infinatley adjustable and always you have the stuff in stock! (And he thought I never lstened to him.)

I was reading a book that told how tubes were rejeuventated in THE OLD DAYS. . I am just repeating what I read so dont shot the messenger BUT it said 40 volts were applied to the tube for several minutes to boil the thoriated metal from inside the heater wire to the surface then the tube was run I beleive it said for two hours and a slightly above average voltage and then allowed to cool. It said this often brought bum tubes back to life.. I guess if the tube doesnt work anyway you have zip to lose. I have on vintage 45 tube that will not function at 2.5 but needs 5 at least to run. I guess it is about beat so I.ll keep it for pictures. I run my vintage tubes on battery power. I used to use a 6 volt motorcycle battery but that gets messy if you spill it I switched to gel batteries which are easy to find and buy.(TSC store for farm fencers as well as Ebay) I also bought the big recharable flashlights when on sale and some have 4.5 volt batteries in the and some have 6 volters. Currently for this last XVCR project I bought at Walmart a pair of rechargable D batteries. I have them in a standard RS holder and even though 3 volts they run the 56 tube just fine. I now am going to buy several more and connect them so I get the 3 volts but 3 times the volume if you will allow me to use that term. I can recharge them easily with even just a wallwart 3 volter and can build a wooden box to house them so they look period correct. The biggest favour you can do your radio espcially a regen rcvr is put the heater on battery power . This applys BTW to directly or indirectly heated tubes. And of course the tx as well. The HMMMM is GONE! It doesnt come in the B supply. even with a transformerless supplys of which I have several. . It comes in from the heaters. Why? Ich weisse nicht? It just does.

Question maybe for Don or anyone else who may have suggestions. I have a German ham friend from my EME days who is interested in antique radio. He is interested in circuits that would have been popular in Germany back in the day (mainly 1920s I think), using parts that would have been available there at that time. Any suggestions on where he might look?

My RX is a all valve (tube) set based on a design from the 1959 ARRL handbook, called the simpleX super as its a superhet with a xtal filter: but in my case the filter is an improved ladder filter design by Dave G3UUR
the TX is is a single 807 xtal oscillator running into another 807 as the PA with a maximum of 50 watts out (700 volts on the anode of the PA) most of the xtals are hand ground. The TX began life as a single 807 power oscillator with a input of 10 watts and only 3 to 4 watts out to aid stability
I also run homebrew SSB gear which I use on the hombrew net, the net is on 3727 most days at 1pm clock time. The aerial in both cases is a 140 foot end fed but on SSB I use a screenmed loop on the RX and on the simplx super RX I use a noise nuller/steer'er
The SSB RX is quite posh having a H mode mixer in the front end and a huff and puff VFO

I'm not sure about the 40 volt number, but I'm familiar with the method. I seem to remember the recommended voltage being 50-100% above the normal rated filament voltage, but don't take my word for it without researching it for yourself.

Note this method ONLY works for thoriated tungsten filaments, and will VERY quickly kill whatever emission remains from an oxide-coated filament or cathode - don't ask me how I know this.

Germany had a lot of the same things going on we did over here. Of course radio waves were discovered in Karlsruhe Germany by Mr herz which is we got Herz instead of MCs etc. The Volksemfanger is a popular two tube set that is often seen. It was radios answer to the Volkswagon.I have seen a few of them. Meissner circuits and Heising etc have there roots there. Ham radio was not active for a long time after we were all doing it here. I have poked around the Radiomuseum site (aus der Schweiz)often and there are lots of German circuits there. Best display I have seen so far is Sinsheim Techniks Museum in Sinsheim Germany. Thay have a radio room plus displays all along the north wall. Our stuff their stuff everyones stuff. Also on the radioboard there is a German language section for homebrew and restoration projects. I have been known to hang in there now and then. Good group. Just for the record. my immediate family left in 1709. We have been NA here since 1756 and 1760 and wound up here in the GWN cause we got throwed out of USA. (1784) However I speak the language and visit my original family there often. Blood is pretty thick you know. You is what you is. Punkt
German electronics are very good.

Speaking of filament voltage, what happens if you power a 201 tube with 5vac?

I asked about this a while ago. Paraphrasing, the answer was... OK for a transmitter, maybe OK for an audio amplifier, but definitely not for a detector.

I run my vintage tubes on battery power.

That's the most period correct method. I gave it serious thought but I just know the batteries would always be dead when I needed them. I have a long history of not getting along well with batteries.

The HMMMM is GONE! It doesnt come in the B supply. even with a transformerless supplys of which I have several. . It comes in from the heaters. Why? Ich weisse nicht? It just does.

I have no experience with vintage receivers YET, but I can only suspect if there is hum when operating a filament on DC from a power supply, that supply is not adequately filtered for this critical application. It takes some serious filtering to get ALL the ripple out. I was recently given an AC-operated A/B/C battery eliminator for old sets. I got it from a radio collector and I'm told it is clean and will operate the old battery sets without hum. It is homebrew, not an antique supply but not ultra modern. It does use solid state devices. I used an oscilloscope to look at the A voltage while supplying 5VDC to a 2 amp load. It was a perfectly flat line with no discernable ripple. I cannot say the same for most of my DC power supplies, even those rated for much higher current. Most of them have at least a few millivolts of ripple with no load at all on them. I may end up using this modern-ish A/B/C eliminator for the A supply on my receiver for a while, if I haven't figured out a more appealing option by the time I get the receiver built.

That is interesting, Steve. Any chance it was RF affecting the power supply?

Initial tests on my TNT were done with HP variable DC supplies for both filament and plate. The '01A was a little growly. The '71A was more than a little growly.

Later I put a '210 in the socket and swapped out the HP variable supply on the filament for 7.5VAC cleverly stolen from a pile of heavy iron. This configuration was less growly but still not a pure note. 150 pounds of iron to get 7.5VAC at 1.25A! Crazy lash-up that is! Did I mention the dozen clip leads? ;-)

On the last test I swapped out the plate variable HP supply for something else and the note became pure.

I will probably never know for sure but I wonder if both of those HP supplies were reacting to RF. I'm certain the plate supply was, as the voltage was sagging some 25V with keying at one fourth the rated load of that precision regulated supply.

On the other hand it could just be these things have a mind of their own and change on a whim! I wonder what will happen when I get a proper power supply built...

73,
Paul

There is that possibility as with the same DC supply on 80m, the note was T9...I guess that in itself might indicate an RF issue since it was frequency-dependent.

> On the other hand it could just be these things have a mind of their own
> and change on a whim!

I have found this to be the case exactly. Every single time I have set up the TNT or Hartley for an extended run, something behaves differently than when it was set up and run previously, even though nothing has changed in the set up...all part of the fun really.

4996. Self-Rectifying CW Sets

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-17 21:12:20 UTC
From: cwopr@embarqmail.com
Topic: 4996 Message: 4996

Good afternoon all,
I am still trying to decide what type of period pwr supply to go with for the 1924 four coil Meissner. I have ruled out the chem. rectifiers/filters (not hard to do). I have probably ruled out a 1924 tube type rectifier (not many available and would be pricey)....could possibly go into 1925 and find one...maybe a UX-213. No to a m-g set...no to batteries (need +/- 225 plate voltage). About the only things left are the ford spark coil and the self-rectifying method. The s-r method looks fairly simple...just get whatever voltage needed from a transformer, secondary thru a rf choke(s) and then to the plate(s). The end result is a modulated cw signal at 60 or 120cps (120cps if using two tubes in parallel). Or one can use ac voltages at other frequencies, such as an alternator at 700cps, which would modulate the cw signal at 700cps.

Of course, the s-r and ford coil would produce a rather rough note (by todays standards) and would be used for AWA purposes only. A better sounding supply would be available for normal use. I am leaning toward the self-rectifying method, at least, to try. The question is, what parameters would the rf choke(s) be made to. In an article in Dec 1920 QST, P. 7, entitled "Self-Rectifying CW Sets" the only info on the choke states: "The chokes should be carefully made to have a low distributed capacity, and spaced turns of wire just sufficiently heavy to carry the plate current, wound on an open frame instead of a tube, is suggested". This doesn't tell me a whole lot..so far that's all I've found on the rf choke construction. Do ya think a modern 2.5mh would work...just for testing. Aren't they used in the B+ line to keep rf out of a pwr supply? Does anyone have a suggestion on rf choke construction for use in the s-r method?

I have often seen where stations, of that period, used 'rac'. Was the term 'rac' used as another name for self-rectifying?

Thanks for any explanations...de Bill, K4JYS

As far as I know, yes, rac was another name for self rectifying. I heard one station with rac during the 29 event. Something said he was running a Ford spark gap on the power supply to give it the buzz. I tell you that buzz comes through better than a rough tone. I suppose the buzz is better heard at the OO station to. hi hi Bob Raide use to have a switch on his transmitter so he could switch between raw ac on the plates and dc. He would change from tone to buzz at different parts of the evening. One time late late into the night when stations were few, I heard him alternating between rac and dc inbetween cw characters in his call sign. He must have been really bored at that point. hi hi 73, Scott WA9WFA

It doesnt matter. You can filter it with thounds of ufs You can use are regultor type supply.You can still hear it.Why? Because the regen can hear beynd what is normal. When you use batteries you have almost no noise although you can hear the house wiring. You can hear signals below what you would normally hear. Take a listen to the audio clip I sent Pete. That will give you an idea of weak signal work with a regen. Cerrtainly you can use a regen on ac based supplies and if the signal is strong and near by or a big mega watt broadcaster you can function fine. My Am set recvr uses and ac /dc deal . Filments in series on AC and dc B+. It isnt much good for low level signals especially CW. . The hum level which is not BTW objectionalable. (As good as say a Peavy guitar amp.) is still there and either covers the signal or blanks it.I have tried everything I could think of and other ideas too. I have borrowed supplys and I have built them . I have split filment supplies with caps and resistors . I have added so many capacitors it was silly I have now a battery bank 12 X12 volters . Charges with a diode and and a plug in. . I have at best 167 volts when fully charged I have an average voltage of 156 . I steal the filment voltage from the bottom battery as well. It works great. Tales about a hour to recharge. Once a week deal if I am using it a lot. I run two regens . My single triode and my 12sn7 twinplex style regen from it as well as my 01 TNT. I like it. I can run my regens from the B plus on my am set but I must use battery power for the filments be they directly or indirecly heated. I am thinking of rigging up a charger running for transmit but interrupted for recve so the regen can have pure filment power. It is not that the supply is dirty . It is that a regen works at a level a superhet will never see. It has to BTW . It has only one tube or a 2 tube in 1 tube like a double triode. I have not given up trying to come up with a way but I more and more realize it isnt as easy as one might think.

Hi Scott,
Steve, N8YE, was running a ford spark coil for 'B+'...and was cutting thru the QRM real well. I think, with the ford coil, you can adjust the tone some with the adj. to the gap. I also remember 2ZM and his buzzer...sure miss his usual strong signal. I'm sure he was having a ball with that switch-a-roo. We can keep the OOs interested with some of our signals. Tnx, Bill K4JYS

> Good afternoon all,
> I am still trying to decide what type of period pwr supply to go with for the 1924 four coil Meissner. I have ruled out the chem. rectifiers/filters (not hard to do). I have probably ruled out a 1924 tube type rectifier (not many available and would be pricey)....could possibly go into 1925 and find one...maybe a UX-213. No to a m-g set...no to batteries (need +/- 225 plate voltage). About the only things left are the ford spark coil and the self-rectifying method. The s-r method looks fairly simple...just get whatever voltage needed from a transformer, secondary thru a rf choke(s) and then to the plate(s). The end result is a modulated cw signal at 60 or 120cps (120cps if using two tubes in parallel). Or one can use ac voltages at other frequencies, such as an alternator at 700cps, which would modulate the cw signal at 700cps.
>
> Of course, the s-r and ford coil would produce a rather rough note (by todays standards) and would be used for AWA purposes only. A better sounding supply would be available for normal use. I am leaning toward the self-rectifying method, at least, to try. The question is, what parameters would the rf choke(s) be made to. In an article in Dec 1920 QST, P. 7, entitled "Self-Rectifying CW Sets" the only info on the choke states: "The chokes should be carefully made to have a low distributed capacity, and spaced turns of wire just sufficiently heavy to carry the plate current, wound on an open frame instead of a tube, is suggested". This doesn't tell me a whole lot..so far that's all I've found on the rf choke

construction. Do ya think a modern 2.5mh would work...just for testing. Aren't they used in the B+ line to keep rf out of a pwr supply? Does anyone have a suggestion on rf choke construction for use in the s-r method?
>
> I have often seen where stations, of that period, used 'rac'. Was the term 'rac' used as another name for self-rectifying?

Topic: 5000 Message: 5000

After many different antennas from phased 1/4 wave verticals , a Cushcraft A3 , two inverted Veees ,a pair of inverted Ls and my best yet, a 20 meter copper pipe vertical I decided it was time for a Beverage, I installed it this afternoon along the farm fence here on the ridge. I brought the feed inside a unused room downstairs which I have taken over for the overflow of Hartleys and 1 tube transcievers and such. I was going to put it on air tonite but I am too tired to be safe around my power supplies which I still have to move downstairs and hook up, so I will leave it till tomorrow. My Dad had told me about them years ago bt I never tried one. Tomorrow's the day.
BTW I was talking to Dad tonite. (he just turned 87) He told me "If you ever see an AT3 transmitter, buy it!" During the Big one WWII Dad was an RCAF Wireless Mechanic Instructor at No 1 Wireless School. I guess it must have been his favourite. Has all the start up relay sequences memorized he tells me.

Further to the last I talked about tthis hereis the best way to understand Take the audio clip I sent Pete. while listening to it hum quietly but just enuf to be audible. What do you hear now? Most of us would now be able to hear nothing. That is why a regen and a battery are such good friends.
I find them one of the most fascinating radio designs there is. You turn them on , Nothing .....nothing..... then a bit of sound ,,,,,,,,and then a rush of signals as the cathode warms up and starts giving up electrons. The signal going round and round IN THE SAME TUBE. each time getting a boost . amplified thousands of times over its original strength. The load on the tube varies with the signal so we put the headphones in the supply circuit and the varing amplitude of the power going to the tube produces a corresponding signal in the headphones. Me I am addicted to them and have been since I fired up my first one in the early 60s.

> Where is a listing of transmitting tubes that have thoriated tungsten
> filaments?
>

I'm not aware of any such list, Neil, but the RCA Transmitting Tube manual as well as the Eimac tube data sheets indicate the type of filament or heater for each tube (I just checked both here).

Generally speaking, any type we would consider a transmitting power tube with a directly-heated cathode (most of the BIG tubes*) are thoriated tungsten. Even the really old devices (203, 204, 211) have thoriated tungsten filaments. The ubiquitous '10 does as well, although there is at least one variant (the VT-25A) which uses an oxide-coated filament instead.

Tubes with thoriated tungsten filaments produce "white" light, while oxide-coated filaments glow a dull red. Examples of the latter would be the '01A, '45, 71A, which are "receiving tubes" sometimes abused here at NE1S as transmitting tubes ;-)

* an example of a large transmitting tube with an indirectly heated cathode is the 8877, which is (or was) used in some commercially-made linear amplifiers for the "amateur radio market."

Hi Bill and all, Yes I miss hearing W2ZM as well. At one time I'd hear the three stalwarts calling AWA after most everyone shut down for the evening , W2ZM, WA3FFC, and KB0ROB. This year it was just KB0ROB. I had a chance to meet Bob W2ZM at the 2007 AWA convention. I told him we missed him and he said that he just didn't have any interest in 1929 stuff anymore, and there wasn't any sadness in his voice. So like everything else, the only thing constant with the 29 QSO Party is that its membership is changing. New people come, people go, people gain interest, people lose interest, people are busy, etc...

No I dont' want any OO's pestering me. There was a local OO who have lived just a few miles from me because he ran 80m cw nets all the time and was pegging the meter. As you would imagine, my 10 watt input signal must have been pegging his meter too, and he was on 80m all the time, so he would hear me. Got an OO note from him one year.

Geez, I think there is alot more opportunity to patrol for poor signals and bad behavior outside of the CW portion of 80m. I rarely hear bad behavior in the cw bands and never hear any bad behavior from the 1929'ers. Of course, I never hear any poor signals from 1929'ers either, they all sound wonderful to me. hi hi

Hmmm, I haven't been following this thread but I read Don's post this morning and found it intriguing. While I have operated my three tube regen (type 30's) off of a stack of 5 nine volt batteries and filaments from two 1.5 VAC D-cells, it never occurred to me to put together a larger 150 volt stack for the 'bigger radio's' like the National SW-3 and SW-5 that require 150 vdc or more to operate. My 3 tuber is soooooooo quiet compared to AC powere receivers.

I operate my SW-3 off a National Dog House supply with a 150 volt zener to semi regulate the 225 down to 150. Gads, your rechargeable HV stack would let that receiver hear into eternity.

Tell me again how you charge the stack. Thanks for the initriguing idea.

It doesnt matter. You can filter it with thounds of ufs You can use are regultor type supply.You can still hear it.Why? Because the regen can hear beynd what is normal. When you use batteries you have almost no noise although you can hear the house wiring. You can hear signals below what you would normally hear. Take a listen to the audio clip I sent Pete. That will give you an idea of weak signal work with a regen. Cerrtainly you can use a regen on ac based supplies and if the signal is strong and near by or a big mega watt broadcaster you can function fine. My Am set recvr uses and ac /dc deal . Filments in series on AC and dc B+. It isnt much good for low level signals especially CW. . The hum level which is not BTW objectionalable. (As good as say a Peavy guitar amp.) is still there and either covers the signal or blanks it.I have tried everything I could think of and other ideas too. I have borrowed supplys and I have built them . I have split filment supplies with caps and resistors . I have added so many capacitors it was silly I have now a battery bank 12 X12 volters . Charges with a diode and and a plug in. . I have at best 167 volts when fully charged I have an average voltage of 156 . I steal the filment voltage from the bottom battery as well. It works great. Tales about a hour to recharge. Once a week deal if I am using it a lot. I run two regens . My single triode and my 12sn7 twinplex style regen from it as well as my 01 TNT. I like it. The '01A actually has a thoriated tungsten filament. I've rejuvenated several by putting 6.3 volts on the filament (no plate voltage) for an hour.

I think the non-A variants of the UV203 and UV204 may have used pure tungsten filaments like the UV200, UV201, and UV202.

While the '01A's, '71A's, and '45's are technically receiving tubes, they were very commonly used in transmitting circuits in late 20's QST magazines.
Contrary to popular modern practice, '27 tubes were never used as transmitting RF oscillators or amplifiers since they were more expensive than the smaller power tubes and offered no particular advantage for the purpose.

Hi Guys,

W2ZM was a regular feature, indeed, on the occasion of the 1929 QSO Party...

I sure do miss Bob! He'd do some pretty wild & crazy things on the occasion of the Sunday afternoon AM net when he was net controller, too---like the time he got on with a loop-modulated 201A rig! Only W2ZM would even attempt to do such a thing! Yet he'd always pull it off...

His raspy / buzzy self-rectified(!) rig's signal on the BK affair was a thing unto itself, too---no wonder Bob repeatedly won the '29 QSO Party---there was just no missing his signal...and you couldn't get anywhere near it, either, it was so very broad!

What a great pity he's lost interest in things 1929 like that...oh well, he may yet come 'round again, bigger & badder than ever...time will tell!

After reading Don's comments I must admit I am more anxious to get my regen built and experiment with various methods of powering it. A bit of hum may not be as detrimental here as it would be in quiet locations. Regardless of the receiver this location is noise limited... arcing power lines, plasma TVs, you name it. This is not noise that any receiver can reject. It is radiated by power lines and other conductors all around me and comes in via the antenna. ANY antenna. Anyway it will be interesting to see what happens with the regen. Don, I guess I missed the audio clip you mentioned sending to Pete. If it was via this group I din't see it and can't seem to locate it.

Since I am now thinking about getting to work on the receiver soon, this morning I disassembled a 1 mfd ACME "Parvolt" condenser for re-stuffing. That was easy once I surmised it was paraffin filled. After straightening the small metal tabs securing the guts, heating in a 200 degree F oven for 15 minutes did the trick nicely. Don't forget to put it in a drip pan! I made a disposable pan of aluminum foil. This condenser is constructed in a way that will make re-stuffing with a modern capacitor and reassembly easy.

Then there's the matter of the label, which is where the real work is. I scanned it at 600 dpi before disassembling the condenser. I spent about 10 hours editing today and I estimate I have about 10% of the label cleaned up. Cleaned up? Hmm. More like re-created. It's a good thing my time isn't worth much. I will have a few hours invested in this restoration but if it turns out nice it will have been well worth it. Finding paint similar to the original may be interesting, but there must be something close out there. I guess I should look around before I go too much further with this label.

73,
Paul

Hi Guys,

I must confess to my not having especially paid close attention to this thread, but after this latest submission from Larry, I suddenly recalled a piece in an older issue of The OTB that warned owners of "non-glowing" 201A tubes---BEFORE writing them off as having burned-out filaments---to first RE-HEAT the filament pins at the base of same...

I don't know if this was ever mentioned in this on-going thread before, or not---if so, I apologize for repeating it.

Anyway, these old rascals---for whatever reason---have a tendency to develop open connections in the filament lead(s) internal to the pins, & quite often the application of heat & a re-flow of the solder in the pins can sometimes bring them back to life...

Here it is. 9 surplus 12 volt gel batteries. ($9 each) Three 4.5 volt gel cells stolen from rechargable flashlights that were on sale for $4.99 each. I circled the diode. it is just connected to a 110 plug. Things i would change.
I would not use the 4.5s but would just put in another 12v (which i have aleady bought) and drop the voltage for filaments with a voltage divider. I might prefer 2 6 volts BTW which would fit in the same spot. 120 vots ac charges much higher when rectified sonce the bateries act like a capacitor. Voltage on a 12 volt cell is tu ypically 13.2 and some cals will go to 13.8. The peak rubs off quickly butthe average is stil quite high. I use them right down to 123volts.
I also need to put a timer on the circuit. Maybe a mechanical one stolen from a cheap toaster oven or something. oterwise someties you forget theyare on charge till your nose tells you. (Or the XYL says thee is a slight sulphur smell in your ham shack. Anything we should be concerned about?) In the meantime I plugged a light into the same switchable extension so if the bank is charging then the light is also on. An hour is usually enuf. If these batteries show up on sale again I will pick up another 12. That would give me more than enuf to power anything I have here.

Eddy, I've reclaimed many dud tubes that way. I heat the pins with a big soldering iron and try to suck out the old solder with a solder sucker. Then apply fresh solder. 6SK7's have another problem. The solder swells up in the pin and splits it open. It's more difficult to remove the old solder because it doesn't melt easily. Once it's removed the pin has to be crimped back into shape before resoldering. Doesn't always work though.

Leonard

To the Group;

Attached is a shematic of a three tube superhet from the 1941 ARRL Handbook. I have all the parts to build

the receiver with a few improvements. One improvement would be single signal reception. To accomplish this

I could make a crystal fiter from two 1600 kc xtals, which I have, or make the IF amp regenerative.

I'm curious to know who favors which method and why?

Two other improvements are, pitch control for the BFO and an audio amp using a 6F6. The audio amp is

shown a few pages after the receiver as an option.

John

John,

The simple superhet works surprisingly well.

I added both a BFO and a really simple xtal filter to mine. See http://www.prismnet.com/~nielw/3tube_xtal/3tube_xtal.htm I put the xtal within the regen feedback path. It does a good job of cutting out the audio image.

I guess $4500 was just a tad more than buyers were willing to pay. But I've seen 62S-1's go for well north of $3000. I was a VHF/EME guy for much of my ham "career" and always rather fancied having one of those - but not at these prices! Way out of my league!

Niel,
I do remember when you improved your simple superhet. I like the addition of the xtal filter and BFO.
One question on the xtal filter, how much attenuation is there with it in the circuit?
Another question, do you mute the audio or just push the phones off your ears when transmitting?

The schematic I posted is of the next project in the Handbook from the one you based your superhet on. This design doesn't use a regenerative detector. The 6C8 is a diode detector and BFO from the start. I figured an xtal would go between T2 and the grid of the detector, similar to what you did.

If I went with a regenerative IF amp one approach would be to feed some of the signal from the plate back to the grid with a gimmick cap, then add a pot in the cathode circuit to control feedback. Alternately a tickler coil from the grid could be installed in the IF can. I've never tried any of these mods before, only read about them so this is new ground for me.

5019. Rectivating Thoriated Tungsten Filaments

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-20 21:34:48 UTC
From: JAMES HANLON
Topic: 5019 Message: 5019

The following is a direct quote from my well worn copy of The Radio Handbook, 15th Edition, 1959, (Editors and Engineers) pages 68 and 69.

"Reactivating Thoriated-Tungsten Filaments Thoriated-tungsten filaments (and only thoriated-tungsten filaments) which have lost emission as a result of insufficient filament voltage, a severe temporary overload, a less severe extended overload, or even normal operation may quite frequently be reactivated to their original characteristics by a process similar to that of the original activation. However only filaments which have not approached too close to the end of their useful life may be successfully reactivated.

"The actual process of reactivation is relatively simple. The tube which has gone 'flat' is placed in a socket to which only the two filament wires have been connected. The filament is then 'flashed' for about 20 to 40 seconds at about 1 1/2 times normal rated voltage. The filament will become extremely bright during this time and, if there is still some thoria left in the tungsten and if the tube did not originally fail as a result of an air leak, some of this thoria will be reduced to metallic thorium. The filament is then burned at 15 to 25 percent overvoltage for from 30 minutes to 3 to 4 hours to bring this new thorium to the surface.

"The tube should then be tested to see if it shows signs of renewed life. If it does, but is still weak, the burning process should be continued at 10 to 15 percent overvoltage for a few more hours. This should bring it back almost to normal. If the tube checks still very low after the first attempt at reactivation, the complete process can be repeated as a last effort."

Hope this helps,

Jim, W8KGI

John,

OK, I now see what you are basing your project on.

re. selectivity via regenerative IFs... According to the 1942 ARRL Handbook (pg 129) a regenerative IF in a superhet can get you "a pronounced single-signal effect" but the IF needs to be at 455KHz or lower. I assume that you can't get there at 1600KHz with just a transformer based regenerative IF.

In my revised design I swapped out the 1/2 6C8 triode regenerative detector for a 6J7. This allowed controlling regeneration via the screen voltage. The tickler coil in the plate circuit feeds back into L5, the only "IF transformer" in my simple design. The crystal is in between L5 and the regen detector grid. Regeneration can be turned up to overcome any crystal insertion loss. When I use mine I run regeneration close to oscillation but not quite. This is the most selective point. The BFO provides the note. With this I can almost completely eliminate a strong audio image. You may be able to do something similar around the 6SK7 in your three tube superhet.

I do have a lot of trouble zero beating my transmitter frequency. I typically just turn the AF gain down and listen to it grunt when transmitting.

Thanks for the info Niel.
I do recall reading that selectivity is much easier to obtain at the lower IF freqs, 455kc and less. It might be in my '43 Handbook, I'm missing the '42.
Hopefully with the 6SK IF amp and 6F6 audio stage I can get sufficient recovered audio using a xtal filter. Since I have two 1600kc xtals I'm thinking a two pole filter can be made.

5026. Further 1 tube transciever

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-21 18:23:48 UTC
From: Don
Topic: 5026 Message: 5026

I have learned a few things. Some the hard way.
I had this little rig working pretty good then got the dumb idea to put some HD volts to it. After all the 56 tube can easily stand 350V so it can probably handle 450v in short periods.
On Tx it didnt even flinch however on RX it smoked the 500K pot (pot and earphonesare bypassed on TX). It took me till yesterday to find another good one. I did some further testing. It also popped my grid leak cap. All this stems from too high a voltage since current in a recvr is minimal. (ie 10 9 volts will last some 6 months as B plus for a regen)I am able to run 153 volts with no trouble. I have moved the gridleak to 3.9M. not because I intended to but because I am colour blind and goofed. It seemed to like it though so it stays. Right now volume is sometimes too loud and I have to cut way back on the controls. That is unusual for a single triode tube regen. I can run the b + from my AM rigs PS. It is a simple deal , half wave with three resistors droping voltage for various applications. After each dropping resistpr there is a 400 volt 40uf cap. It is very quiet. I am running the filaments on 2 rechargable 1.5 Rayovac batteries. (they are really not 1.5 but more like 1.2 s which works out to 2.4 volts which is perfect.) I am building a DC supply using what I know about building B plus supplies but applied to A power. It might be a waste of time but if the B plus supplies are quiet then the A should be too. In the meantime I am convinced the batteries and regens belong together but I am not closedminded to the possibilty that I can get a workable deal. I am building a identical B + supply with it so I can power it all from one deal. Hopefully.
The transceiver project is a complete success. It would be nice if the PS was too but ????
Oh yeah i forgot. I had the tube shields from the old radio and installed one over the 56. It will not work with it on. I had to try. Tis how I learn.

Don, with that kind of voltage I sure hope you don't have B+ on your 'fones.

> On Tx it didnt even flinch however on RX it smoked the 500K pot (pot and
> earphonesare bypassed on TX). It took me till yesterday to find another

The current may not be minimal with that kind of voltage on it. When high voltage smokes something it is usually because a maximum breakdown voltage is exceeded, and as a result a high current flows.

Be careful out there...

5030. manmade interference

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-22 02:55:03 UTC
From: Don
Topic: 5030 Message: 5030

As we all know there is a lot of man made RF interference around.It seems to me Lou told me at his QTH S5 with no signal in noise level. Tonite our power went out and has been out for over an hour. After our company went home I went over to my battery powerd Regens and switched on the Twinplex 1930s model. SPOOKEY! At first I thought it wast working but I reached down in the darkness and turned the fine tune condensor and there they were ."beeeeep beep beeep beep." No backgound hum, no noise hash , nothing but pure signal. This is how it must have been in the twenties previous to electrification. Having heard it that quiet I am now probably ruined for life. It is interesting that happened since I have been doing some testing around the house for noise sources. The very worst? CFL light bulbs. Unbeleivable how much noise comes from them . Freq is about 3742 near as I can tell. LED light bulbs ? None.
Full size florescents? Some noise but not bad. My compaq laptop terrible. The worst on 80 meters but nothing compared to CFLs. We should not be tolerating this RFI invasion of our 80M band. These things have to go. Dimmer controls are another cuplrit I am told but I havent checked them out myself.(yet) I have baned CFLs from our house now. I have a power transformer accross the road that feeds me that is very noisy. I have tried to have the Hydro company replace it but they wont. A couple of years ago it was on fire when I got up with a bright arc lighting the pole where it is accross the road. I had high hopes it would be gone as it bothered my 10M reception terrible. I located the source with a portable recvr. Apparently it is an old PCB filled transformer and disposal is a problem now so they want to keep it going as long as possilble.It has been patched, had ground clamps repaired and the burnt off wire repaired but it s still here. I cant seem to do anything about that but I can get rid of the stuff in my home like the CFLs. On a nite like tonite when there is no electricty flowing for `15 miles around me it sure was interesting to turn on the regen and listen. We dont realize how much RF noise our modern living generates I fear.

yes. The voltage on the phones is relative and is in fact only the votage drop accross them I believe I measured it last year for someone and it was 8 volts on my twinplex. You can put the phones in the ground circuit to. it works just as well. I tried that also. I use a set of navy insulated phones on this one. No exposed wires and isulared ear pads as well.

So I've decided to use a xtal filter in the 1941 superhet. Like I said, I have two 1600kc xtals, which should make a half lattice filter.

How does one go about designing a simple half lattice filter?

I've done a little reading on the subject but still not sure what value of mica caps to use. I like the filter Sandy, NS1W used on his two tube superhet.
http://people.csail.mit.edu/sw/html/NS1W/hb-rx.html
Scroll down to the bottom of th page for schematics.
Sandy used old FT-241 xtals, I'll use HC6.

Anyway, any help is appreciated.

Because the pot is connected from B plus to ground with only the phones in the way arcing is what occurs in the pot when the wiper arm get close to a dimple in the case for instance at 40+ volts. Anyway. I love this radio and will not subject it to such further nonsense. It works fine at around 15v0 to 160v which is more than enuf for me to enjoy it. I intend to keep it that way.

Exactly Don. It is a jungle out there.

I take S meter readings with a grain of salt because all rigs are calibrated differently. But with all the rigs I have tried my noise on 80 meters with "normal" antennas like a dipole or vertical is over S9. Years ago I resorted to Beverages to hear anything. I have 8 switchable receive directions and those antennas are placed as far away from buildings as possible. Typically 300 feet or more at the closest point. During the recent Bruce Kelley event I could hear some 3 or 4 of the strongest stations on my 80 and 40 meter dipoles. With the Beverages I could hear dozens more. But even on the Beverages my noise level is high. I tried listening with the rig on battery power during a power outage once. I was amazed how quiet it was and what I could hear! Wow!

I have eliminated all the offenders from my own home. Computer power supplies, CRT monitors, light dimmers, DVD player (power supply probably) were the worst offenders. Some CFLs are noisy but I have some that are perfectly clean as far as I can tell. It seems to depend on the brand mostly.

My neighbor's plasma TV raises my noise floor 5 to 30 dB on all bands when it is on (exact amount depends on frequency and what direction I'm listening). Plasma TVs are notorious offenders. Another neighbor's furnace brings my noise floor up 6 dB to more than 40 dB on all bands (the level depending mostly on direction). And that is on the Beverages! Forget listening with any other antenna when that thing is running.

Even if all the consumer electronics and electrical devices were gone, I would still have noise from poorly maintained 13.2 kV and 46 kV power lines that run along the street here. At night there are sometimes visible arcs. They don't care. A pole caught fire and burned down a few years ago. They came out and set a new pole, then picked up chipped, blackened insulators from the road and put them on the new pole! Aaarrrgh! I just shook my head in disbelief on that one.

I'm afraid it is just a fact of modern life for all of us and is too far out of control to get a handle on it.

73 & Happy Holidays everyone!
Paul

I'm happy to scan the schematic and put it up on the awagroup site when I find it after unpacking the shack . I got the schematic from Eddy VX3XZ and his Rollins Rocket. My implementation is somewhat different than his but same basic circuit. The two transmitters sound totally different too. I haven't been able to get that sweet yodel from mine, just getting boring dc. hi hi

Leonard,

That's true. I don't think my printer is particularly up to the task of making nice labels, which made his prices seem attractive. But I will continue to mull this matter of the A supply for a while.

This week I built a lower voltage supply for the transceiver. Since it was happy running of theB+ on the AM rig I built a rectified and filtered suppy from the AC mains. I used a pair of 110/24 volt transfomers back to back with a half wave rectifier and double filter caps with a 10 ohm 10watt wirewound in the middle of the caps. First try was a bit high in voltage. I dropped the volatge with a 2k resitor and it is now where it should be. With a regen too much voltage puts the regen in oscillate or transmit mode. Cutting it back at that voltage with the pot is hard on the pot. I have ordered a 2 watt pot as this little ones stollen from old radios are not quite up to the job if the voltage reaches 160+. a supply voltage of 120 to 140 is where it works the best. I may . One you hit transmit mode or full oscillation power including current skyrockets and the poor little pot that was fine when it had 10ma going through it is quickly toasted.I may move the dropping resistor andits filter cap right into the recvr circuit once i have finalized it then it will be a nonssue. Since on transmit that whole suply section is by passedas the transmitter receives ful PS voltage wthout the phones and pot in the circut I could leave the high voltage from the supply just for the extra power it would give and switch the dropping resistor and last cap in when on receive. I just need to wire it in the recve cuit and use the same switch. It takes a lot of fiddling sorting this stuff out. Sometimes you suspect you are on the wrong track but ned to do the smoke test to be sure. Anyway it is comong along fine. I just want to perfect it. . I say all that to say this. I have successfuly made a A supply for the filments that doesnt cause trouble. Here is what I did.
I made the filment supply independant of the B plus. Ie I used a seperate filamnt transfomer . I use a 3 Amp 6.3 centretapped one I had for years. I used the classic diodefrom each outside lead for the plus side joined to a common point connectiong to a 6000 50 volt cap + (I bought a pair of these at Oshawa Hamfest for $2 each) The centre tap Ifed through a 1 1/2 " toriodal choke I got one in a RS choke and coils assortment. It has about#18 wire and was closewound so i knew it would probably work. That went to the neg side of the 6000 uf cap. Voltage when the cap is at full charge is 9.5 V . I took a filment or heater rheo from a scrap 1920s Murdock radio and wired it in series in the neg lead coming from the 6000uf cap. I set it at full resistance and double checked that with my meter just in case I had messed up. I applied the power and was able to keep the filment voltage right around 2.8 with no problem. I know that is .3 high but I doubt it matters much. My powerline varies of 14 volts during the day anyway so it will be slightly above and slightly below sometime during the day. (110v to 124v today from morning till nite ac coming into the house.) There is no decernable hm filemnt on or off so i guess it is a success. Basically I built it like a classic hi voltage supply but withlow voltage componets and values. I beleivethe filment is taking out less than the cap can supply which gets rid of the peaks completely I guess. I watched the volmeter after switch of but with filment draw on. It takes awhile to drop below filment required voltage.
So the A system is full wave but the B is not I will make the B fll wave too. It would only take a couple of minutes to do. Then I need to add a switchable key jack to the B- on the supply and make a cabinet for it. It seemed all too simple but it worked.I think i was complicating a simple operation. I knew the B plus supply in the Am rig was very quiet so I copied its basic design but used transformers for a change. . I BTW bought absolutley nothing to do this . It all came from my junk box or was stolen from discarded projects. The two 24 volt transformers were throwaways from a local heating contractor.

I'm going to give it a listen too. 2AM CST (0800 UTC) is pretty early (or late tonight if you want to look at it that way), but figured what the heck. I've got my Drake TR7 connected to my full-wave 80M H-Loop. I'm hearing 60KHz WWV at about 30dB over S9 so at least I know it's working. Hear a few LF signal below that so lets hope I'll be able to hear those 17.2KHz signals as well. I'll keep the laptop handy to record any audio if I do hear anything.

Good luck to you Don.

AH Thanks. I thought my experiment was a failure. I heard zip. Here is what actually transpired.
I was looking for a quick L for a crystal set type deal . I have become pretty decent making crystal sets and have had one always around since 1964(I got a used diode for Christmas from my Dad (that is all too!) So i figured I had little to lose with making one. The first thing that came to mind was a ignition coil secondary but I figured that was too much. Just estimating from experience i rightly or wrongly figured something in the area of 660 turns on an 1 1/2" cardboard tube would be in the ball park. Another winding of 25% (165 turns)of that would couple the antenna nicely . I didnt have that much wire here . next x choice was a Audio transformer or a PS choke. Since 17kcs is high end audio more or less. (20kcs used to be considered beginning of "real"RF or so I had been told). I fifgured I had zip to lose and whipped up the crystal set using it. You can tell if it is working at al when you hook up the antenna . "No clickee no laundry" so to speak. I got a sharpe click and we live a couple of miles from a MW station transmitter site so I get Bc band interference in non active devices regularily. I could hear the station in the phones immediatley. It wasnt tuned in but it was audible so I know right away the rf can go through the transformer. I used the primary of speaker winding for antenna and the tube side winding for tank circuitalong with a small 365 pf varable cap. I used a small signal diode from my junk box (probably a 1n94A or something and a set of Brandes 2000 ohm phones. Did it tune at all? Using the BC interfence as a reference I tuned the variable cap back and forth. It did definatley affect it although nothing like it would if the tank was on freq for the BC station. Everything worked so I got up at 2.30 here and double checked and waited. I had wrongly figured that the BC station went off air at 1 AM and would not be a problem. WRONG! Since I was a boy things have changed. They are now 24 hrs . I thought I would try it anyway. I carefully swept the full tuning range listening. Once I thought I heard something different but then zip. Anyway I will figure out how to test the freq of my tank in the meantime and then will build it solid with an amplifier. Thanks for the heads-up.

Bill thanks for the update. Wow "technical difficulties" and the darn transmitter isn't even 90 years old yet! They just don't build quality into those newer alternator transmitter anymore, hi.

I'll need to wait till next Christmas to try again or perhaps the July transmission. In the meantime I could do some experiments in the mean time to see how the sensitivity is on my TR7 at 17.2Khz. As I mentioned in my last email it hears WWVL at 60KHz at 30dB over S9. I did hear a bunch of signals around 17.2 and I'm sure most of them were man-made. I also have a solid-state Loran-C receive amplifier that I might be able to retune down to 17.2.

Oh well it was exciting to try, albeit a bit tired today having stayed up till 2:30AM.

I must be lucky, then. I don't have two much in the way of noisemakers
here. The hot-plate on the coffee maker makes some noise on the AMBC band
when it's on, but I haven't noticed it on HF. Most of the consumer
electronics stuff in this house is pretty old - some of it very old ;-)
The old computer monitor I use on the Windows box makes noise at certain
frequencies throughout the HF spectrum, but the solution is simple - turn
it off when I'm playing radio. I do have neighbors close-by, though, and
things are still quiet, enough so that noise doesn't bother my ham radio
activities. I was a bit concerned when the electric company installed
their "smart meter" that I might get some interference from the switching
power supply within it, but it has proven itself not to be a problem.

If you have an audio signal generator you can use it to test your VLF radio and set it to frequency. That's what I do when I want to try to hear SAQ on my RAK rcvr. (but so far I haven't heard them. I haven't tried much, though, and I DO have a lot of noise on LF and VLF here.)

If you have an audio signal generator you can use it to test your VLF radio and set it to frequency. That's what I do when I want to try to hear SAQ on my RAK rcvr. (but so far I haven't heard them. I haven't tried much, though, and I DO have a lot of noise on LF and VLF here.)

Hi Larry,

I wonder on your old computer monitor do they have the iron core integrated into the video cable? I know on earlier monitors they weren't. On my old terminal in the radio room I was getting a bunch of similar noise until I placed a ferrite on the video cable right up by the terminal input jack. I was amazed how well it worked and have noticed that just about all of the commercial cables have them today.

I must be lucky, then. I don't have two much in the way of noisemakers here. The hot-plate on the coffee maker makes some noise on the AMBC band when it's on, but I haven't noticed it on HF. Most of the consumer electronics stuff in this house is pretty old - some of it very old ;-) The old computer monitor I use on the Windows box makes noise at certain frequencies throughout the HF spectrum, but the solution is simple - turn it off when I'm playing radio. I do have neighbors close-by, though, and things are still quiet, enough so that noise doesn't bother my ham radio activities. I was a bit concerned when the electric company installed their "smart meter" that I might get some interference from the switching power supply within it, but it has proven itself not to be a problem.

HF radio aside, why are so many people against this type of meter? Our local power companie's policy is if they can not get into your backyard to read the meter, they will guesstimate your monthly bill. Having dogs and wanting to keep the gates locked, the wireless meters have solved this problem for us.

I have almost finished another amp for my am rig. I need to put the plug (old tube base) on the power cable and find the bias pot I set aside for it. After that and a wiring check it will be time for the smoke test. It has tuned input tuned output with a 6l6GA It is built so it can be expanded to four 6L6 tubes. My light duty PS will handle two nicely and probably three. i will get one working before I get cute with it. Next project is the POW radio from soup can lids and pencil lead etc. I talked about it earlier this year and have a drwer full of (found stuff to make it from. I think it will be a lot of fun to do. I will jig up and start drilling soup can lids tomorrow. Now I am thinking a "no vacuum" tube deal. Always wanted to try. If the reason we have vaccum s to peserve the filment (like in an incandesant lamp blb) then one should be able to produce amplifier anction with three elemnts and a blow torch or oil,lamp. And of course now that I have established that a regen can very easily also be a transmitter all radios from here will now be rx tx built. Basically requires a switch.

If you are talking about lower HF then I'd say you were very lucky with this. I have chased a number of issues relating to noisy CRT monitors both at my station and others. Very rarely have I found clamp-on ferrites effective at lower HF. The upper HF bands are a little easier, and at VHF the clamp ons begin to be quite effective. Sometimes, for the lower HF bands, winding as many turns of the cable as possible on a #31 mix toroid core helps, but VGA cables are usually too fat to get enough turns on the largest toroid available (2.4"). Multiple such chokes can be put in series, which requires using an extension cable. An even bigger problem is the connector, which drastically limits what one can do unless one is willing to cut it off and install a new connector after winding the choke(s).

Having dogs and wanting to keep the gates locked, the wireless meters have solved this problem for us.

In today's world people often tend to become hysterical when they hear about any device which emits RF energy. It amazes me that people are afraid of getting fried by RF from such devices but think nothing of talking on a cell phone pressed against their head. The other problem, at least here, was people being convinced this new technology was a way to cheat them on their electric bill.

Personally I like the new meters. No more keeping a path cleared to the meter all winter! Which reminds me... I have to go out and shovel snow. :-(

Hi Paul,

D'you mean that Maine actually had a WHITE Christmas this year...?!

We here in the supposed "Great White North" were greeted Christmas morn with still-green grass on the ground, & a temperature of 34F...and I heard on the radio that parts of New Mexico were buried under 10" of the white stuff!

It's a mad, mad, mad, mad, mad, mad world, alright...! Hi Hi

~73~ de Eddy VE3CUI - VE3XZ

PS: Speaking of mad, the reason people here in "VE3"-land are up in arms over the universal adoption of so called "smart meters" is the fact that our provincial government has incorporated "prime time" now with respect to household power usage---in other words, our electric billing rats are HIGHER in "prime time", i.e. 7:00 AM to 9:00 PM (I believe). What it boils down to is that households will save considerable money if we all do our laundry & bathing in the wee hours of the morning rather than prime time...and the smart meters will squeal on everyone, everytime, to "Big Brother".

Sweet, huh...?

Is your State doing the same thing...?

Hi Don,

My (CRT) monitor is old, but not THAT old: it has a ferrite core molded
into the cable by the VGA connector. Still noisy.

Here the power company offered the option of keeping the old meter, at an extra monthly charge. I called the information number they provided, and asked questions about the frequency the unit transmitted on (above 1 GHz as I recall), power level, etc. They couldn't answer all my questions, so they had their technical specialist call me. He seemed like a really good guy, and was able to answer the rest of my questions. Though not a ham, he was a SWL, and could sympathize with my concerns. He said he wanted to know about any interference problems, would come out to help me analyze them, and if there was no other solution he would arrange for me to keep my old electromechanical meter at no extra charge until the problem was resolved. Like I had said, that hasn't been necessary.

D'you mean that Maine actually had a WHITE Christmas this year...?!

Hi Eddy,

Yup. It snowed (albeit lightly) all through Christmas eve, Christmas day and into the night. It was lovely! Nice light fluffy snowflakes with no wind. It only accumulated about 5 inches.

It has been a strange start to winter. We got near a foot of snow in October, then it melted. We got another foot in November, and that melted. We may yet see bare ground again, as rain is being forecast for Wednesday night. Of course a few degrees cooler than expected and that could turn into to a major snow storm.

our provincial government has incorporated "prime time" now with respect to household power usage

Is your State doing the same thing...?

Not yet. We have had smart meters for 5+ years (I forget exactly when they were installed).

Some interest...good!

Pse go to Files: "1933 P-P UX-245 Hartley Rig", The entire article including power supply, antenna dope and monitor is there.

Watch the trading in Johnson brown standoffs, lard tins, porcelain based AC switches, Type 30s, Bakelite tubing and on go nuts.

Lou, just saw your version of this regen...beautiful. How well does it work? I built the one tuber from a 1935 Radio mag and it works quite well.....how abt a report on yours. The combo looks like a project possibility.. ..B

Bee,

I built it in the early 80s. Operated it twice than put it away. All I recall is that it did copy 80 mtr sigs, but "finicky". Just needed to be poked and prodded I'm sure.

My favorite radio , The regen. I do all my Cw work with a regen. I have here I think mmmm??
4 tube type. The twinplex is afar and away the best. Runs on a 12 inch loop antenna sitting
in the window. It was what I usud for the QSO earlier this year.
I started into the pow radio build today. I will spent about 15 minutes a day if possible.
Tomorrow I am hunting for "found" wire for the coil. Also some old board to build it on.
Don Ve3LYX
tin can lids soon to become a variable cap.

Poking and proding. or stuff I learned the hard way.
first # 1 problem with most regens is they cover too much frequency with their tuning range. For example I built the powerhouse regen from pop elec mag. It covers from 3.6 to 13,2 mcs on the one coil. That is too much. Why? Because during the tuning range conditions for regen vary too many times. Some are real good . Some are borderline. This is with a 365pf tuning cap. A 50pf would be more than enuf for the variable cap and a fixed cap can be used to pad it to the sweet spot. That would cover the CW portion of any band.
2 problem is hand capacity. These are some of the cures.
A Steel framed or metal framed variable cap should always be used. And the frame should be at ground potential. (ie when using vintage variable caps made from pheonelic or bakelite the hand cap problem is much worse than with steel or metal framed ones. Ceramic tirmmers also fall into the bad catagorery) Variable cap should be installed back from the sets faceplate at least a couple of inches. An insiauted shaft helps some. Verniers with metal dials should be avoided. if possible
#3 The antenna should be coupled to the grid side of the coil by a small adjustable trimmer cap. When the circuit wont go properly a slight adjustment here makes world of difference. This cap should have very small value.
#4 Regens are sometimes not happy with a resonat antenna. A good two tube regen or a double triode regen should work fine on an indoor loop. By fine I mean can hear anything your kenwood or yaseu can on a resonat antenna. (With a single triode regen the big antenna is needed but once you step up to a two stage radio it becomes an obstacle rather than an aid.
#5 The addition of a Rf stage in front is a hindrance and DOES NOT!!!!!!!!!! stop radiation. It actually seems to help it. I have built them both ways. I speak from experience. The best way to keep a regen from radiating is close control of the regen control and circuit stabilty. No more than enuf voltage to make it work well goes a long long way to eliminating it. I have two that will not emit a hearable signal in an nearby receiver. One I have never tested (It is pre 1920 original) and one (with the RF amp) I can actually spot just by turning up the regen control.In fact it was this radio that lead me to the last regen RX TX project. The big difference between a regen and a transmitter or power oscillator is plate voltage. A regen stays just below what is necessary for osillation and a tx stays above it.No osc = no radiation. I always suspected this but now having built an operable regen/tranciever deal I know for sure it is the case. With the simple flip of a switch I go from regen recvr to power oscillator, the switch simply bypassing the regen pot and phones which in effect removes 502K resistance from the plate circuit . The rise in plate voltage pushes the circuit into full solid oscllation and we off like a herd of turtles in Cw mode.
#6 While it is possible to run a regen on an AC supply performance is greatly inhanced on battery power. B batteries will last a long time and so are a no issue. (10 nine volters snapped together will run it up to 6 months in normal use.) The A battery need to be recharged regularly. There are many workable options here. A 6 volt car battery being probably the best. A 6 V gel battery almost as good. I used for many years a 6 volt motocycle lead acid battery. It would run longer than I needed it and recharged relativley quickly.
BTW the conventional hartley circuit is my personal favourite currently. No tickler coil and can be coupled to the antenna either by a trimmer capacitor or a antenna coupling coil.

(moveable of you want real slick.)

The POW style build continues.
Wooden end plates for the variable cap made from someones dicarded piece of 1/4 inch plywood.
Grid leak resistor. on scrap plywood base made with a HB pencil. Measures 1.98Mohms. You have to be carefull . My first attempt was only 393K . It doesnt take much. 1.9M should be almost perfect for a gridleak on a regen.
Ist attempt at a gridleak cap netted only .24pfs Not good. One forgets that the Gridleak is actually huge. Similar to the tuning cap capacitiy. I have a plan though. This is made from a discarded pie plate and some wax paper.
A coil and a tube of some sort is left to find. I see a toilet paper roll in my future and I will try some old copper based electric fence wire left on the fence from my cattle raising days. I am thinking 20 metre band but havent decided for sure. Dx is is what one would want if they we incarcerated in a foreign land.

The tuning cap trial fit. Almost ok. Just a little tweak on one plate and two washers and I think it is there. Remember I just need them not to touch. Anything beyond that is pure bonus.

I went out this morning and got the copperweld fence wire of the corrral. It is no good for radio work (hi resistance)so I went to plan B. I removed a switch from the house wall and relocated it on the next closest stud. I got about 20 inches of old paper covered 14/2 which includes a ground wire (bare) (I should say the XYL had asked me to move the switch anyway but if I was incarcerated in a wooden based building this would be a realistic deal and doable . (I did not turn off the power BTW so forget that "some one would have noticed." However do not try this at home!) One strand is not enuf for a proper 40M coil. It is just barely enuf for 1/2 but since we are building a hartley based cicuit the white wire makes one coil section and the black wire carries on from the required centre tap. I also have almost 20 inches of bare copper wire left which will be used for hookup in wire wrap style. (no solder will be used.)
I also found a discarded 171 tube that has "weak?" written on it. It shall be used if possible. I have to find the wooden 4 pin socket I made earlier this year but I know I would not have chucked it.

Here is the wooden tube socket I made along with a shaky 01A I happen to have (i will use the found 171 though if possible) I know I said no solder and I see I had soldered the wires on the tube socket. I am not going to change that now. Just remember that solder has nothong to do with the tube contact or its operation it was just to keep it from unraveling. I apologize for this oversight on my part. Not much needed now. Just the rework of the gridleak cap and final wiring. Also here is the 1/2 earphone set. My pal Bob actually found this lying in the dirt at our Dump. I live in a farming community so serendipity entres into it (as it would anyway in a real situation)however I suspect a receiver stolen from a 50s 60s telephone would work in a pinch. Since I have one I will try it later and see once I have fiddled enuf to get it working.

5108. Anti-Corona Paint: FINALE

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-29 14:37:58 UTC
From: Eddy Swynar
Topic: 5108 Message: 5108

Good Day All,

Many thanks for the many FB responses that I received here my recent query in the matter of GLYPTAL insulating paint / anti-corona dope...

Yesterday I visited my jobber in Toronto, & some eleven-plus dollars later exited with 2 ounce bottle of "MG Chemicals"-brand "RED INSULATING VARNISH" ("Protect motor winding, transformers, and coils from arcing, discharge, moisture, and oxidation"). The specs at the back of the box it came in state that it's a modified alkyd with a dielectric strength of 3KV / mil---"Only one coat required. Apply additional coats if extra protection or security is desired."

I plan to use it on one of the Centralab rotary directivity switches that I use here with my phased transmitting array: awhile back I had a dragging detente in one wafer, with a consequent "not meshed" switch contact. The result was an arc to the binding rod that interconnects the wafers.

To-day I hope to scrape away the carbon track that was left on the ceramic, & coat all of the nearby metal with the insulating varnish (the lazy detente has since been addressed), as an "insurance policy" against any future similar occurance.

Thanks again, & my vy

~73~ de Eddy VE3CUI - VE3XZ

I have the variable cap working with no shorting.
This is the new gridleak cap. It has roughly the same square inchesas the variable in closed position. it has been frustrating. it is very easy to poke a hole through thewax paper when nailed together. I may have to go to two layers. It is made from some used tinfoil pie plates and wax paper. I will have to reassemble it after lunch.

Topic: 5110 Message: 5110

Ever since finishing the build I have been feeling something was a bit odd about the behavior of my TNT rig. Today I finally figured out what's going on. It doesn't seem happy with my antenna.

The rig has a 6 turn copper tubing antenna coil and 1100 mmfd series variable condenser.

Today I discovered that when I put a 50 ohm purely resistive load on it, the rig behaves almost identically from 3.5 to almost 3.9 Mc. Plate current and RF power out are very consistent throughout that range. Plate current, power out, and note quality vary smoothly with coupling of the antenna coil to tank. All good so far.

Now enter the antenna, a coax fed dipole cut for 3.51 Mc. At that frequency, the rig behaves almost identical to what it does on the precision RF load. As I move up the band and the antenna impedance starts rising, things get squirrelly fast. By the time I hit 3.57 Mc the maximum obtainable plate current has fallen off some 30% and the rig insists on being very tightly coupled. Any reduction from maximum possible antenna coupling results in a drastic drop in plate current and power out. Not only that, but the note actually gets WORSE with lighter antenna coupling! It continues to get more and more squirrelly the higher up the band I go.

I find this a little surprising. I didn't expect the rig to react so strongly to relatively minor antenna impedance changes. Cutting the antenna to move the sweet spot up the band would be a poor trade. Then my big rig would be unhappy at the low end of the band.

Now that I (more or less) understand the problem, I suppose I will try to beg, borrow, buy, build or steal (?) a matching network that will bring the antenna Z closer to what the rig likes in the part of the band I would be operating. I think I will just use something modern and hide it under the table.

I switched to normal writing paper and got success with the grid leak cap. I redrew the grid leak R right under the gridleak cap connection ears and got 2.19 M ohms. Everything is here now that I need.
My XYL has a bag of kaput batteries under the sink as she believes in disposing of them properly .I think I can find enuf volts there to power the whole receiver. On receive since I have no regen control (variable plate voltage) I will have to find the sweet spot by trial and error. Probably 22 to 48 volts or in that area. Enuf for the tube to amplfiy but too little for it to break into full oscillation. I dont know if this will work or not but I will give it my best try. I dont see why not but reality is some times a hard taskmaster. We shall see. Nervous? Me? For sure!

I made one (ant matcher)from spare parts. It works surprising well. My one tube txs are a lot more antenna sensitive than by big rig. I have my 40M hartley tuned up on 7100 or there about right now. It took a lot from my antenna tuner to get it happy. Even though my kenwood would not have blinked an eye. I think it is easy to forget that when you have one tube, be it tx or rx you have almost zero wiggle room. When you have a big set say 100 watts or so these minor differences seem insignificant as you have more power that required to do the job. I find also my antenna loading chages with weather etc . I think it loads better at night than during the day.
I often here BTW guys hearing someone giving their rig the final tweak saying "Use the Dummy, Dummy" Easy to say if you are a plug and play guy but as you so rightly pointed out the reality is when switching from a Dummy load to the actual antenna there is still work to be done. Sometimes the difference is greater than one would expect as you so rightly pointed out.

If you want it to be at all a successful regenerative design you will need
some kind of regeneration control - the "sweetspot" of operation is just
too small a window, and is dependent on too many variables.

You could build another variable capacitor as a throttle cap, if that's
easier for you to do than a variable resistor. It's a better way to go
anyway.

Speaking of your hbrew variable cap, I would have used a plastic material
for the end supports, say scrap plexiglas sheet. Wood is very lossy due to
the water component, and the lossiness is variable with the ambient
humidity, because it's hydroscopic.

It's a challenging project you've undertaken, and will be satisfying when
you achieve success.

I have built them with a throttle cap too. Not my favoutite method.They work but Yeah That is the word But.Yes it will be tricky without a regen contol but impossible? Maybe but have the idea I can get it close then add voltage 1 1/2 volts at a time till I get it. I may be wrong but there is only one way to tell. try it. Today just for fun I took a jar and some red wine vinegar I didnt want. I took a old 1 inch dia copper coupling and a 4 inch steel screw I found in the drawer. Almost exactly 1 volt. Anyway you are probably right but I am going to give it the minimalist try first (but you knew that already didnt you?) Yes it has to be super dry for sure otherwise I will loose what I make. I did make a crystal set from a oatmeal box and a iron pyrite. (See youtube "singingrock") It is all on wood and works . Made the vari cap from aluminum foil and cardboard. If I get this to work I will be excitied. Right now I am screwing up the courage to finish it. It is very interesting (for me anyway.) I think the big challenge will be getting this style hartley to work on a direct heated tube. That is my biggest worry anyway.

Thanks Don and Steve.

I guess I thought by some combination of positioning the antenna coil and adjusting the series condenser I'd be able to trick the rig into loading with any more or less reasonable antenna impedance. But as they say "it ain't so". I will buy or build a matching network ASAP.

Topic: 5118 Message: 5118

That darn Lou... ;o)
He's got me all fired up to get the TNT on 160m!

This isn't exactly a new idea. I had planned to put the rig on 160m from the start, but months later I'm still floundering.

It is VERY important to me that it be done in a way appropriate to 1929 or as close as I can possibly come. Sorry, that's just how I am! It isn't about "rules". It is about what I personally wish to achieve for my own satisfaction.

The first problem is how to get enough inductance in a grid coil that will fit the available space. I would like to use a 1" bakelite form, same as I did for the 80m coil. Wire small enough to wind 100 turns per inch is indicated. It MAY be just possible to get there with 90 turns per inch but I believe it would be on the "hairy edge".

Was plain enamelled wire available in 1929?
Was it ever used for winding radio coils then?
What color(s) might it have been?

Is there any hope of finding silk or cotton covered wire small enough today? (I believe it would take #32 SSC, #34 DSC or SCC)

#34 to #36 DSC would probably be ideal. Anybody got some???

Next we come to the tank and antenna coils. I have some 3" OD bakelite tube which I could use for coil forms.

I suppose #12 bare copper would be '29 appropriate. BUT after some experimentation I have serious doubts about my ability to space wind the stuff and have it stay put on slippery bakelite! Not to mention I have yet to come up with a promising method of securing the ends that lends itself to coil mounting and removal on the TNT without turns coming loose.

Any tips? Suggestions? Other ideas?

Well its is all wired. Of course every clandestine radio needs a good disguise. This is a bird house or as you can see when it gets its side and roof it will be. . The tuning knob is the perch. An old colleque is coming this afternoon for a visit so I have to stop here and get ready. I have powered up a couple of circuits. So far it looks good. Earphone is wired into the plate supply. I checked it too with a quick touch on the battery test. Despite its hard life at the dump it works! Bonus!
I am as nervous as a kitten in a doghouse. I would like to press on right now but will restrain myself so I can recheck everything and have lots of time to try and find its regen spot. Rushed deals are never good.

No justification is needed - it is your choice to make. I have had projects I have approached in the same way. Not all of them, but several.

The 1933 PP TNT article in Short Wave Craft by Shuart W2AMN specifies 150 turns end-to-end of #36 DSC on a 3"-long 1"-dia. bakelite tube. To a first approximation the parasitic (tube) capacitance is doubled in a single-ended design, so inductance must be halved to maintain the same frequency. Since inductance is proportional to the # of turns squared (also an approximation), this means something greater than half the number of turns will be required. But the self-capacitance ("turn-to-turn") also plays into it, and this is a huge factor. Maybe you already have the specs for the coil you need.

> Was plain enamelled wire available in 1929?

I'm pretty sure the iron-core transformers (audio, power) in 1920s radios were mostly wound with enameled magnet wire. Heck, the primaries Aero coils specified for some 1920s regens were wound with enameled wire. The tickler and antenna windings appear to be silk or cotton-covered, though.

> Was it ever used for winding radio coils then?

See above.

> What color(s) might it have been?
>

The Aero coil primaries are the ubiquitous reddish-brown enamel.

George Grammer wrote a QST article for a 160M Hartley in 1932. I'll bet that coil would plug-and-play in a TNT, and that the materials/method he used then are 1929-appropriate. I don't have the precise reference handy at the moment.

> Maybe you already have the specs for the coil you need.

I do, more or less.

An article in April, 1931 QST has these words on the subject:

"The grid coil for a 1750-kc. TNT oscillator will have approximately
2.5 times as many turns, on the same diameter form, as for 3500-kc.
operation, the exact number of turns being determined by experiment(3)."

"3. The distributed capacity of the grid coil and the input capacity
of the tube afect the tuning of the grid coil. These factors are
influenced by so many things (type of tube, stray wiring capacity,
operating plate impedance, size of wire, etc.) that it is
practically impossible to give exact coil specifications. The
process of trial and error is easy," ... [etc.]

Based on that, and the fact the 80 meter coil has 60 turns, I would
start with 150 turns and remove some until I found the sweet spot.
Since I am limited to a winding length of 1.5 inches maximum, I
calculated the wire size(s) required to fit 150 turns or so.

My mathematical analysis of the resulting coils seems to suggest
they should be "about right" also. I'm buried in a sea of papers
with scribbled figures and notes! ;-)

> Heck, the primaries Aero
> coils specified for some 1920s regens were wound with enameled wire.

Aha! Thanks for that info!

>> #34 to #36 DSC would probably be ideal. Anybody got some???
>
> Probably. I'll look.

Please let me know if you do (and if I don't have to come pick it
up)! However you seem to have given me sufficient justification for
using enameled wire if need be. I will look and see if I have any in
appropriate sizes.

OK. I will see if I can find it. It would be interesting to see how
he constructed the coils.

I built a pi netwrok with a 14 turn 2 3/4 inch coil in the middle tapped at every turn. I used a switch from I believe pre vaccum tube days but it was normal back then just to use a allagator clip too. I also made provisions for bypass the L and inserting a tripple gang C in the upper line. I use a field strength meter with its ant plugged into the unit for tune up. It is my own deal but does it ever work. The caps are from the 30s except for the last one. It is a 40s 50s deal. I doubt I could buy the equivalent unit I was able to build. I used 5/16 " copper tubing for the L section. To tap it I drilled a 3/32 hole in each loop and inserted a piece of #14 copper wire in each hole. Using our solder (electrical rosin core) I soldered each of these taps with a small butane hand held pocket torch. I built it on wood save for the ground side of the antenna connections are commn to a piece of L bent aluminm. Total cost was about $12 . The rest came from the junk box. This is the one I made the big knob for. I use the unit almost every day. So far I havent hit a "I cant tune that." It works so well I wonder why I lived without one for so long, not to mention it was fun to build.

> Any tips? Suggestions? Other ideas?

Paul...wonderful to hear of your possible 160m TNT coils! The 1931 QST article (Hartley), using a 500mmfd tank condenser, specifies 18 turns of #12 enamelled on a 2 1/2" bakelite form, spaced to occupy 2 1/2". The antenna tank is the same, only with 12 turns spaced over 1 3/4". The text indicates that the coil should first be wound to the specified number of turns and then a heavy string should be wound between the turns in order to spread them out enough to fill the required space. The space is first defined by mounting two 1/2" 6-32 screws at the appropriate distance. The coil is secured to these screws with a knurled brass nut. It further indicates that it is quite alright to leave the string in place, as long as it is waxed, to prevent moisture absorption. These are the same specs I used on my Hull Hartley 160m coils except I used some #14 electrical wire with black PVC jacket, letting the jacket do the spacing. The tuning was right on, with resonance at the high-C point.

Since you are wishing to keep things as authentic as possible you might also wish to consider what the prudent amateur of the day might have done, as I'm sure they were a very resourceful bunch. The coils could just as readily be wound, and probably were, with some cotton covered hookup wire appopriate to the day, allowing the cotton to take care of the spacing. Your bakelite form sounds delicious and the fewer number of turns for the increased diameter of your forms could readily be calculated.

I powered it up tonite. I found enuf half dead batteries to get 62 volts. B + but it seemed to like 56 volts better. . All I have right here tonite is an ac heater supply but I hooked it up anyway. No descernable signal but when put myh and near the tube it goes wha wha so something rf is happening. Too noisy with straight ac on heater. I will regroup tomorrow and run a line to my battery box. The 171 tube it turns out is no good at all so I stole a 01 from my tnt for the test. I measured voltages. Gridleak resistor is indicating proper voltage accross it. . Plate and cathode voltages are good. I am concerned about the gridleak cap but will try a sub bypass in the morning although I do believe the tube woulld not show hand capacity problem if the grid leak was not functioning in some manner. However just to be sure I will try 150pfs accross it since I know it isnt shorted. Sound also changes dramtically when antenna is hooked direct vrs loose coupled so something is going on. What would I consider success? Absolutley any signal . That would mean it is working.

Hi Eddy,

What is a "lightning calculator"?

I have an old ARRL L/C/F calculator which I got when I was studying for my ham ticket in 1980. The thing has been a wonderful companion through many projects over the years. It has been put to good (?) use once again over the past couple of days, calculating various coil possibilities for this project. :-)

I never found finding the values hard. I found measuring the values hard. Ie 10 uuh and 200pf . 200 pf isnt bad because it is 54% opening on a 365 variable or just a bit less than halfway. But the henry stuff????? I dont have a quicky for henries and dont have an inductance meter but I do have a quicky for frequency. 1/4 of the freq in wavelength(Metres) will somewhere on a 365 pf variable get you on frequency with that many turns on the coil. 1/4 of that calculation will give you a usuable link coil as well. If you error error on the short side (less turns)
IE if you wind 10 turns and use a 365 pfs you can do both 80 and 40M (and 30M as well.)
Diameter? Whatever turns your crank. It will still get you on freq at least 40M somewhere in a cap sweep. Crude? simplistic ? Certainly. Effective? Absolutley! So you can set there frustrated for days wondering how to make the coil or just do it thatway and at worst discover you need to remove 1 turn or add 10pf padding. I remember my Dad asking me to stop by the EMI lab and wind some 136Mhz coils for him to make a trap for a marine radio that was seceptable to 136 mhz interference. First one I wound with no serious caculations was right on freq. I never told him how I figured it. (he is by the PEng with a Masters) He never asked.

Thanks for the coil info and photo of your version, Steve!

I found some #30 enameled that MIGHT be usable for the grid coil. At
90 t.p.i. it is marginal at best. If I decide to go with enameled I
think I would be better off to buy some #32 or #34 and not push my
luck. It might look nice to use enameled wire for all the coils,
assuming I can space it and make it stay put.

73,
Paul

I have it on DC heater now. Very quiet. Just a slight tube sound. I had trouble with contact on the grid pin in my wooden socket. Some rolled up aluminum foil took care of that. It reacts to finger touch of the grid wire like a normal radio would . Distinct HMMMMMMMM. It appears to tune and at one point I thought I heard something but it may have been wishful thinking. I wil try later tonite. I subbed the gridleak cap for a real one. No difference. I will redo that test tonite when the band are hot. Meanwhile in another part of the house experiments have begun ona indirectly heated triode. Pic in my albumn

> How does it key on 20m Paul?

Better than I expected, Steve! I will make a recording tonight or tomorrow. Slightly more growl and chirp than on 80 meters, but all in all quite usable. There does seem to be a bit of thermal drift that is not present on 80m. It is making about 6 watts out.

It might get better in some respect with a proper grid coil. At the moment it is 9 turns of #30 dcc taped to a form and just laying on the board. The ends of the #30 are clamped to the grid coil mounting brackets with machine screws and thumb nuts. I want to save this remaining bit of 1" bakelite tube for the 160m grid coil, but as soon as I find a suitable substitute (even if it's a modern material) I think I'll make a set of coils for 40, 30, and 20m.

73,
Paul

5137. TNT Coils for 160

Yahoo group: AWAGroup (2010 — 2011)

From: JAMES HANLON
Topic: 5137 Message: 5137

From both my 1931 and 1935 ARRL Handbooks, the following coils are specified for 160 for a TNT using a 500 mmfd tuning capacitor. Tubes specified are either a UX-210 with a 500 vdc plate supply and a 7.5 vac filament supply or a '01-A with a 135 volt dc plate supply and a 6 vdc filament supply.

Plate coil: 25 turns of #14 dcc on a 3" diameter form with spacing between turns equal to the diameter of the wire.

Grid coil of 150 turns on the same size form as the other grid coils. The number of turns on the grid coil(s) may reqqire some modification. Turns should be added or removed until the set operates stably and efficiently over the required frequency band.

Elsewhere in the article, it says, "the grid coils are wound with #30 dcc wire on 2 1/2 inch length of 1 inch tubing which may be of bakelite, paper, wood or any other of the common insulating materials. The coils should be given a coat of collodion or clear Duco varnish to maintain their characteristics.

I'd be glad to copy the article for anyone who is interested.

Jim, W8KGI

as soon as I find a suitable substitute (even if it's a modern material) I think I'll make a set of coils for 40, 30, and 20m.

How about this stuff Paul? Standard hardware store ABS plastic pipe. Cut, sand, polish, paint, drill, wind, solder, done.

Fakelite, or better yet...Lou-kelite

Steve, KK7UV

5139. TNT keying on 20m

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-12-31 23:01:28 UTC
From: N1BUG
Topic: 5139 Message: 5139

For those who may be curious, I have made a sound clip of my TNT on 20 meters. The file is a bit large so I won't attach it here. I will send it to anyone who asks. It is also available on my web site. I can't post a link because this message will get flagged as spam if I do. However if you navigate to n1bug dot com you will find a link for vintage sounds. It's at the bottom of that page.

For this test the rig was making 6 watts output, 550V dropping to 520V key down. It will make more power but the note gets rougher. The grid coil is still just a taped together thing laying on the board.

Fakelite, or better yet……Lou-kelite

Ha! I love it!

Looks nice. I will see if either of my local tiny hardware stores have it when they re-open on Tuesday.

I was thinking phenolic XX tube. It's tan/brown... but possibly could be painted.

73,
Paul

Hi Paul,

That's exactly what it is!

Back in the day, ARRL sold TWO versions (if I recall correctly), i.e. one for resistance / capacitance calculations, & one for inductance / capacitance / resonance. The early versions were cardboard, with a pointer that rotated in a circular manner---the latter ones were of a slide-rule format.

I use mine here all the time: it shows you what the resonant frequency is with whatever L/C you might choose, & the back of it has a really neat quickie calculator telling you the inductance of a coil based upon length, diameter, & turns per inch.

A very handy device to have in the shack, IMHO...
